

## **Industrial Steam Systems** **Virtual INPLT Training & Assessment**

Session 8

Tuesday – May 25, 2021

10 am – 12:30 pm

# Agenda – Session EIGHT

- Safety and Housekeeping
- Today's Content:
  - Review of Session 7
  - Specific Topics & Applications
  - Presentations from VINPLT attendees
- Q&A

# Safety and Housekeeping

- Safety Moment
  - Look out for your colleagues – speak up if you see something that is not right and if you believe someone can get hurt in a situation
- Break points after each sub-section where you can ask questions
- When you are not asking a question, please MUTE your mic and this will provide the best sound quality for all participants
- We will be recording all these webinars and by staying on-line and attending the meeting you are giving your consent to be recorded
  - A link to the recorded webinars will be provided, afterwards

# Steam Virtual INPLT Agenda

- **Week 1 (April 6) – Industrial Steam Systems Fundamentals and Introduction to SSST**
- **Week 2 (April 13) – Focus on Steam System Generation and Introduction to DOE’s MEASUR Tool**
- **Week 3 (April 20) – Steam System Generation & Cogeneration (CHP)**
- **Week 4 (April 27) – Steam System Distribution, End-Use & Condensate Recovery**
- **Week 5 (May 4) – Energy Efficiency Opportunities in the Generation Area**
- **Week 6 (May 11) – Energy Efficiency Opportunities in Generation & Cogeneration (CHP) Areas**
- **Week 7 (May 18) – Energy Efficiency Opportunities in Distribution, End-use and Condensate Recovery**
- **Week 8 (May 25) – Industrial Steam System VINPLT Wrap-up Presentations**

# Session 7 – Review

# Pipe Failures

- Steam leaks occur in all plants and a continuous improvement type steam leak management program should be implemented in industrial plants
- An “order of magnitude” steam loss estimate can provide enough information to determine if the repair must be made immediately, during a future shutdown, or online
- Pipe failures (steam leaks) often present a “safety issue” that demands immediate attention

# Insulation Evaluation Software

Determining your Insulation needs has never been easier.

**ENERGY**

Insulation Thickness  
Energy Loss/Gain  
Cost of Energy

**ECONOMICS**

Calculations for New Insulation Projects  
Calculations from Previous Projects

**ENVIRONMENT**

CO2 Reduction with Insulation Thickness

**3E plus**<sup>®</sup>

Insulation Thickness  
Computer Program

Calculates Thermal Performance of Piping and Equipment

Translates BTU Losses into Actual Dollars

Calculates Greenhouse Gas Emissions and Reductions

Brought to you by  
**NAIMA**  
NORTH AMERICAN INSULATION  
MANUFACTURERS ASSOCIATION

- [Pipe Insulation | Calculate Thickness | 3E Plus Software \(insulationinstitute.org\)](http://insulationinstitute.org)
- Software outputs include:
  - Surface heat transfer loss
  - Insulation surface temperature
  - Simple payback, Life Cycle Cost of an insulating project

# Steam System Insulation

- Why is insulation necessary on steam systems?
  - Personnel safety – high temperatures
  - Minimize energy losses
  - Protection from ambient conditions
  - Preserve system integrity
- Typical areas of insulation improvement opportunities
  - Distribution headers
  - Inspection man-ways
  - Valves
  - Condensate return lines
  - End-use equipment
  - Storage tanks, vessels, etc.

# Steam Demand

- Steam demands take on many different forms
- Reducing steam consumption can often result in the most significant energy reduction opportunities
  - Eliminate inappropriate steam use
  - Reduce appropriate steam use
- Nevertheless, it is extremely difficult to cover end-uses that are specific to industrial processes in a general class
  - Hence, general methods will be described and tools provided to capture and quantify steam demand savings

# Common Best Practices – End-Use

- Reduce steam usage by a process
  - Improving the efficiency of the process
  - Shifting steam demand to a waste heat source
- Reduce the steam pressure needed by process, especially in cogeneration systems
- Upgrade low pressure (or waste) steam to supply process demands
- Process integration leading to overall energy optimization of the plant

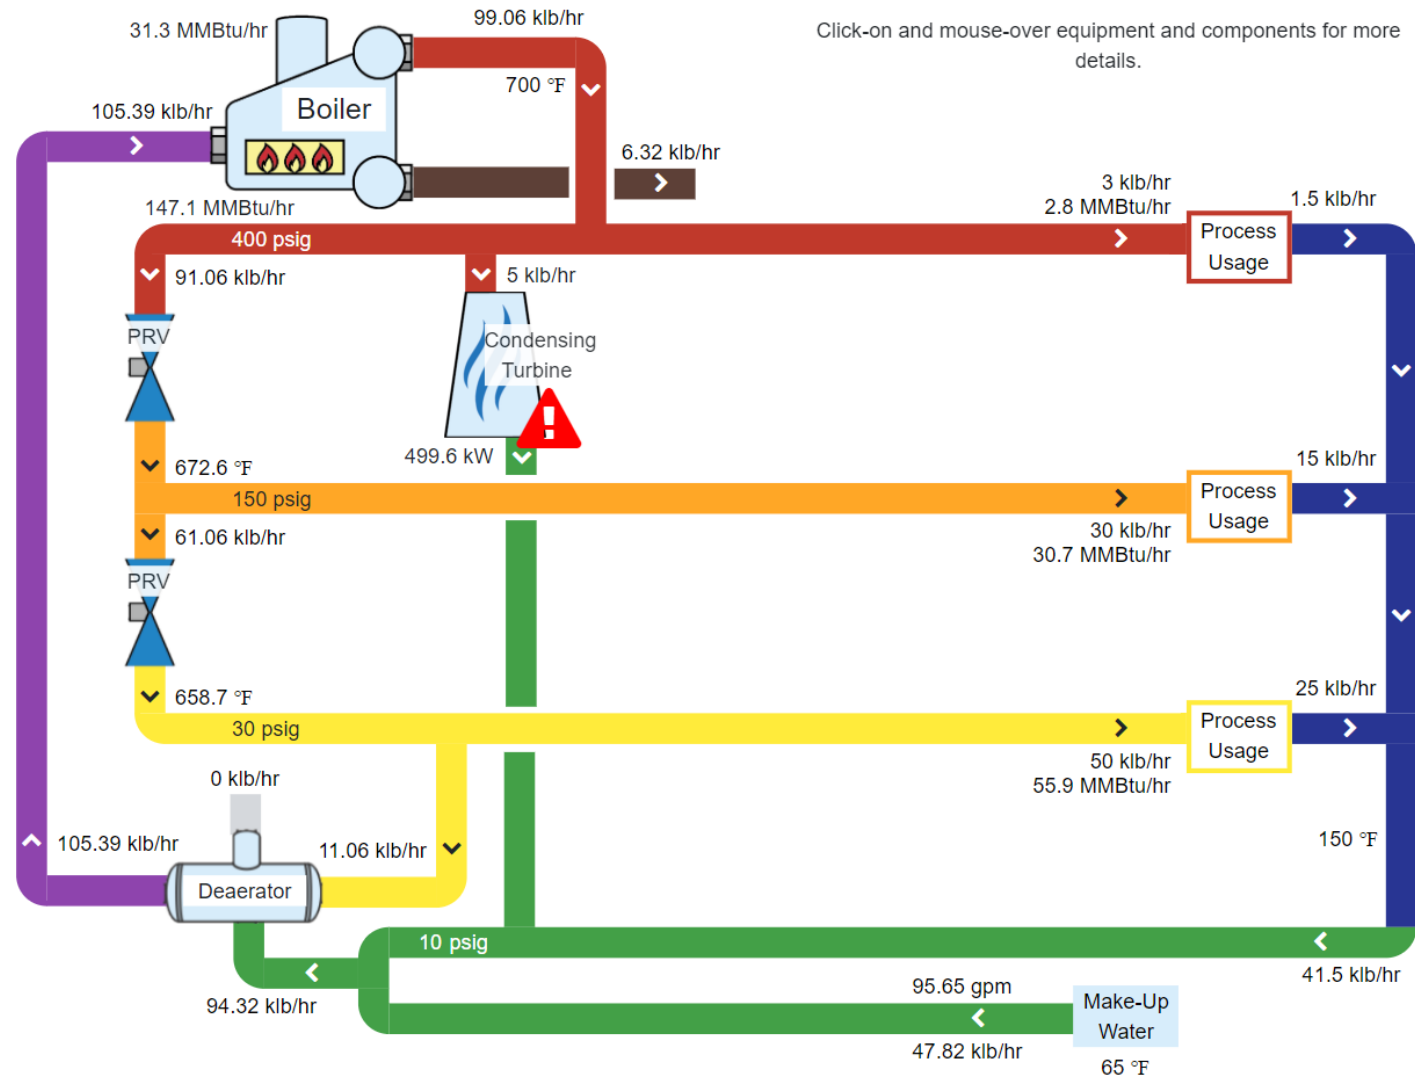

# Effective Steam Trap Management Program

- Maintain a steam trap database
  - Type of trap, model number, size, etc
  - Application
  - Energy loss if failed open
  - Problems if failed closed
  - When was the last recorded failure, repair
- Prioritize repairs based on loss estimates and criticality of steam system and production operations
- Daily monitor receiver vents
- Inspect all traps at least once a year
- Trap maintenance training is essential

# Condensate Recovery

- Condensate typically has worth
  - Energy
  - Make-up water reduction
    - This generally improves feedwater quality
      - Resulting in a reduction in boiler blowdown
  - Chemicals
- Condensate recovery costs generally center on the recovery system piping
  - Recovery equipment
  - Return piping

# MEASUR – Pulp & Paper Mill Model

# MEASUR – Pulp & Paper Mill Model

## COST SUMMARY

Power Balance	
Generation	499.6 kW
Demand	5,499.6 kW
Import	5,000 kW
Unit Cost	\$0.05 /kWh
<b>Total \$/yr</b>	<b>\$2,190,000</b>

Fuel Balance	
Boiler	147.05 MMBtu/hr
Unit Cost	\$5.00 /MMBtu
<b>Total \$/yr</b>	<b>\$6,440,979</b>

Make-Up Water	
Flow	95.65 gpm 50,272,661.49 gal
Unit Cost	\$0.01 /gal
<b>Total \$/yr</b>	<b>\$502,727</b>

Total Operating Cost	
	<b>\$9,133,705</b>

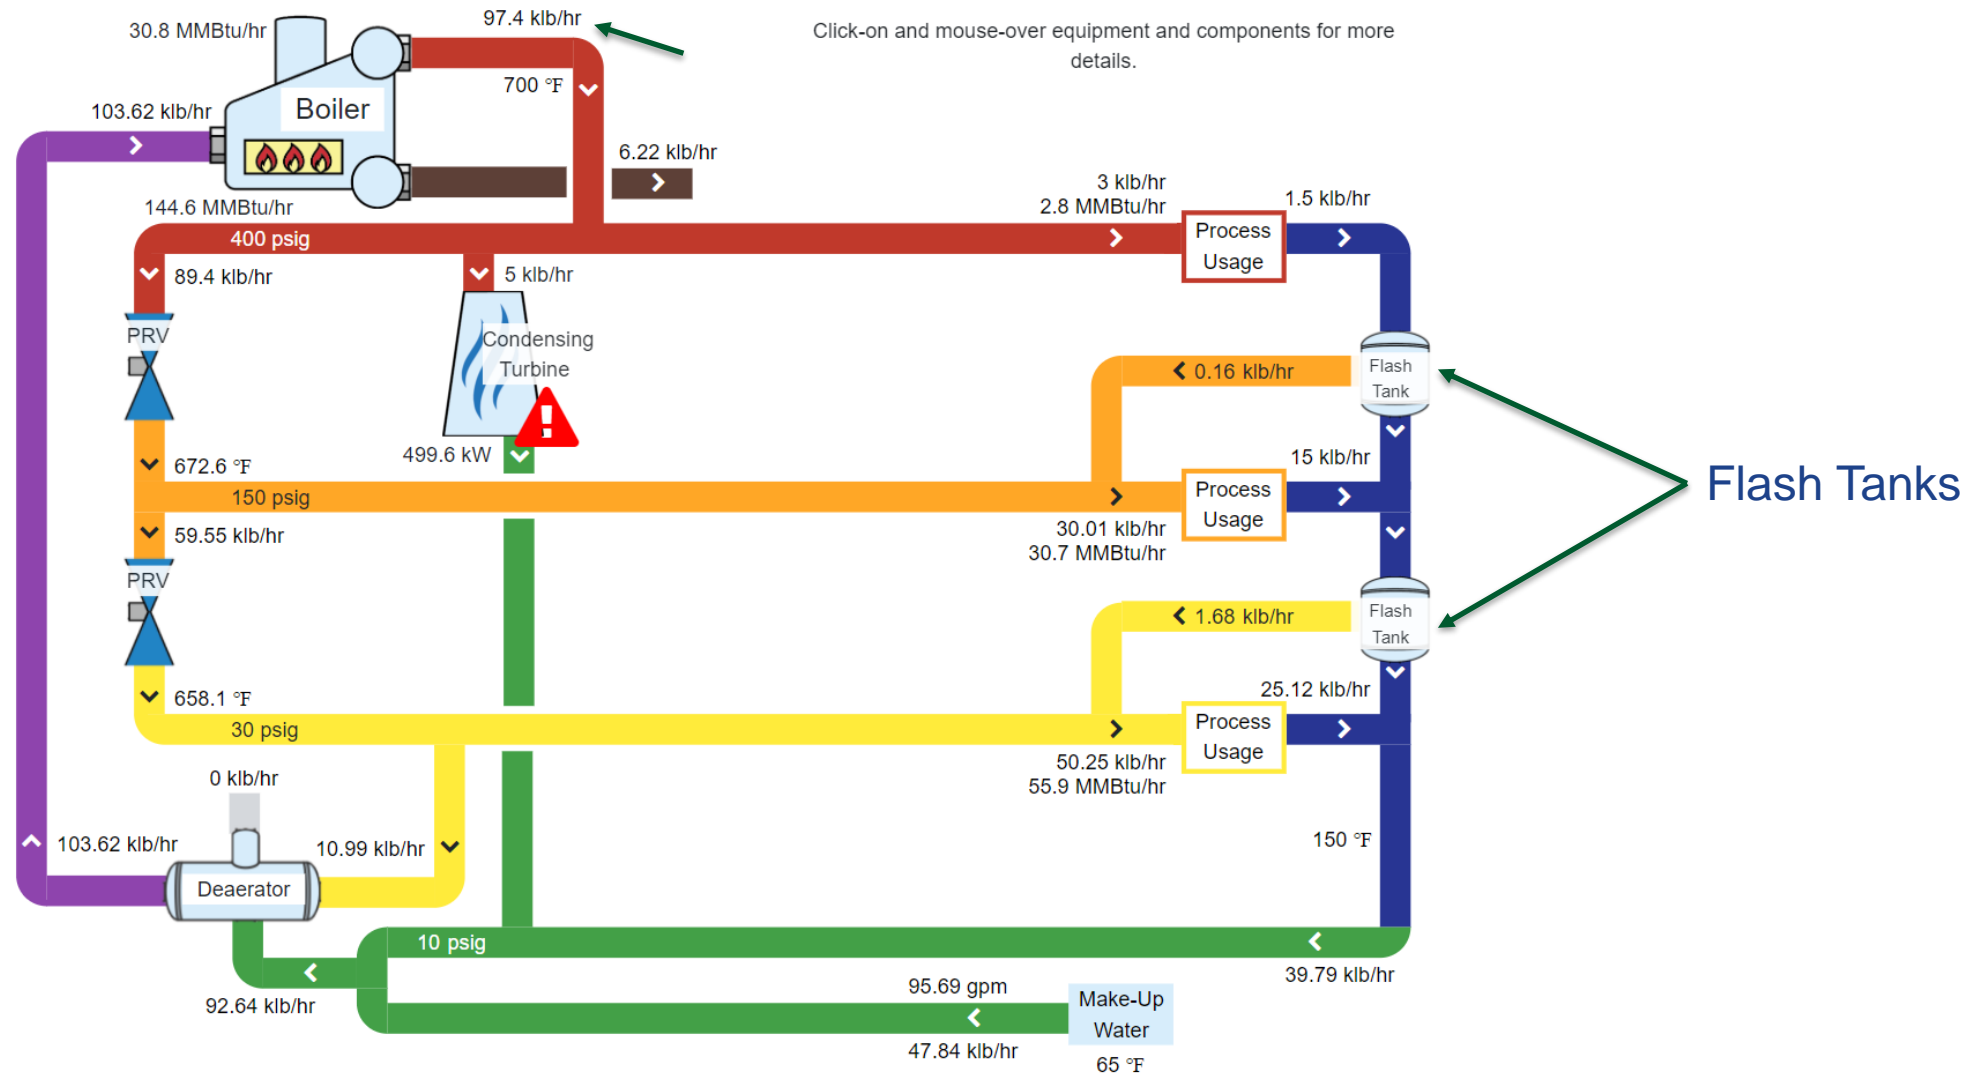

## MARGINAL STEAM COST

High Pressure	\$9.04 /klb
Medium Pressure	\$9.04 /klb
Low Pressure	\$9.04 /klb

## Energy Efficiency Opportunities (Heat Recovery)

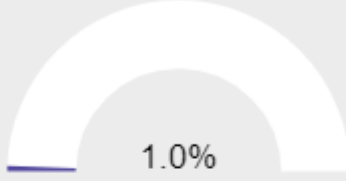

- **Condensate Flash Steam Recovery**

# MEASUR – Pulp & Paper Mill Model

# MEASUR – Pulp & Paper Mill Model

RESULTS	SANKEY		HELP
	Baseline	Condensate Flash Tanks	
Percent Savings (%)	—	—	 1.0%
Fuel Usage (MMBtu/yr)	1,288,195.7	1,266,614.1	
Fuel Cost (\$/yr)	\$6,440,979	\$6,333,070	
Electricity Usage (kW/yr)	43,800,000	43,800,000	
Electricity Cost (\$/yr)	\$2,190,000	\$2,190,000	
Water Usage (gal/yr)	50,272,661.5	50,295,192.6	
Water Cost (\$/yr)	\$502,727	\$502,952	
Power Generated (kW/yr)	499.6	499.6	
Process Use (MMBtu/yr)	89.5	89.5	
Stack Loss (MMBtu/yr)	31.3	30.8	
Vent Losses (MMBtu/yr)	0	0	
Unrecycled Condensate Losses (MMBtu/yr)	11.8	11.8	
Turbine Losses (MMBtu/yr)	0.1	0.1	
Other Losses (MMBtu/yr)	9.6	7.6	
<b>Annual Cost (\$/yr)</b>	<b>\$9,133,705</b>	<b>\$9,026,022</b>	
<b>Annual Savings (\$/yr)</b>	<b>—</b>	<b>\$107,683</b>

## MARGINAL STEAM COST

High Pressure	\$8.27 /klb
Medium Pressure	\$8.64 /klb
Low Pressure	\$9.04 /klb

## Energy Efficiency Opportunities (Distribution, Recovery)

- **Ultrasonic Steam Trap testing**

# Steam Traps - Working

# Steam Traps - Working

# Steam Traps – NOT Working

# Desuperheaters

# Letdowns / PRVs

- Pressure Reducing Valves (PRVs) are most prevalent method of reducing pressure in a steam system
- A steam system will have one or more PRVs between two headers
- Not all PRVs maybe controlling header pressures

# Letdowns / PRVs

- Steam temperature at the outlet of the PRVs is controlled by feedwater (Desuperheaters)
- Mainly done for
  - Protecting equipment
  - Design conditions
  - Reducing pressure drop in header

# MEASUR – Pulp & Paper Mill Model

## Medium Pressure Header

---

Pressure	<input type="text" value="150"/>	<input type="text" value="psig"/>
Process Steam Usage	<input type="text" value="30"/>	<input type="text" value="klb/hr"/>
Condensate Recovery Rate	<input type="text" value="50"/>	<input type="text" value="%"/>
Flash Condensate Into Header	<input type="text" value="No"/>	<input type="text" value="v"/>
Heat Loss	<input type="text" value="0"/>	<input type="text" value="%"/>
Desuperheat Steam out of Highest Pressure Header	<input type="text" value="Yes"/>	<input type="text" value="v"/>

## COST SUMMARY

### Power Balance

Generation	499.6 kW
Demand	5,499.6 kW
Import	5,000 kW
Unit Cost	\$0.05 /kWh
<b>Total \$/yr</b>	<b>\$2,190,000</b>

### Fuel Balance

Boiler	132.73 MMBtu/hr
Unit Cost	\$5.00 /MMBtu
<b>Total \$/yr</b>	<b>\$5,813,514</b>

### Make-Up Water

Flow	94.42 gpm 49,625,118.87 gal
Unit Cost	\$0.01 /gal
<b>Total \$/yr</b>	<b>\$496,251</b>

### Total Operating Cost

\$8,499,765

## MARGINAL STEAM COST

High Pressure	\$9.04 /klb
Medium Pressure	\$8.28 /klb
Low Pressure	\$8.05 /klb

## Steam System Pressure Reduction

- Is it an Opportunity?

# Steam Pressure Reduction

- When steam is produced for heating purposes only, what benefit would be gained if boiler pressure were reduced?
  - Boiler efficiency improvement
  - Heat transfer losses reduced
  - Leak losses reduced
  - Condensate system flash steam losses reduced
    - If steam loads receive reduced pressure steam

# Pressure Reduction Case Study

- Saturated steam boiler initially operating at 54 psig and 301°F steam conditions
- Steam pressure was reduced to 30 psig (274°F)
  - Steam temperature decreased 27°F
- Flue gas temperature decreased 25°F
  - This reduced the stack loss approximately 1.0%
    - Fuel requirement is 99% of the original fuel requirement for the same thermal energy supply
    - The boiler was burning number 2 fuel oil

# Pressure Reduction Case Study -Continued

- Heat transfer loss from a properly insulated pipe should decrease by more than 10%
  - This is developed from 3E Plus
- A steam leak would reduce by more than 30%

# Steam Pressure Reduction

- What are the major problems associated with reducing system pressure?
  - Boiler carryover potential increases
    - Water-hammer
    - Increased water treatment costs
    - Poor boiler water chemistry control
    - Equipment fouling
      - Equipment corrosion
    - Equipment erosion
    - Energy loss

# Steam Pressure Reduction

- What are the major problems associated with reducing system pressure?
  - Steam supply problems resulting from increased frictional loss
    - Pipe diameter may not be sufficient to supply the steam demand
    - Valve size
  - Condensate recovery and return issues resulting from reduced driving pressure
  - Heat exchanger temperature difference reduces limiting heat transfer

# Steam Pressure Reduction

- **Exercise caution when implementing this activity**
  - **There maybe potential SYSTEM problems**
- **System pressure reduction is a very common recommendation**
  - **This recommendation may not receive as much evaluation as necessary**

## Energy Efficiency Opportunities (Generation)

- **Waste Heat Recovery Boilers**

# Waste Heat Recovery Boilers

- Waste Heat Recovery (WHR) boilers can take several forms depending on the source of waste heat
  - Heat Recovery Steam Generators (HRSGs) on exhaust of combustion turbines
  - Exothermic reaction in a process
  - Heat of combustion of burning waste liquids, etc. in an incinerator
  - Recovery of chemicals
  - Stack loss from a process heater, furnace, etc.
- In most cases, WHR boilers are NOT Impact boilers
- In several cases, WHR boilers may be generating steam at a medium or lower pressure

# Waste Heat Recovery Boilers

- The main questions that need to be answered in an analysis with WHR boilers
  - Can more steam be produced from the WHR boilers?
  - If yes, then is the steam system still balanced from a demand and supply perspective?
  - Can steam produced from the WHR boiler offset steam produced from a fuel-fired boiler?
- From a modeling perspective, WHR boilers are best handled by Steam demand savings, if there is a fuel-fired impact boiler in the plant whose load can be reduced due to the steam produced by the WHR boiler

## Energy Efficiency Opportunities

- **Thermocompressors**

# Thermocompressors

- Provide the ability to upgrade low pressure (waste) steam to medium pressure steam thereby reducing the amount of high pressure steam required
- Mechanical vapor compression can also be an alternate option for thermocompressor applications

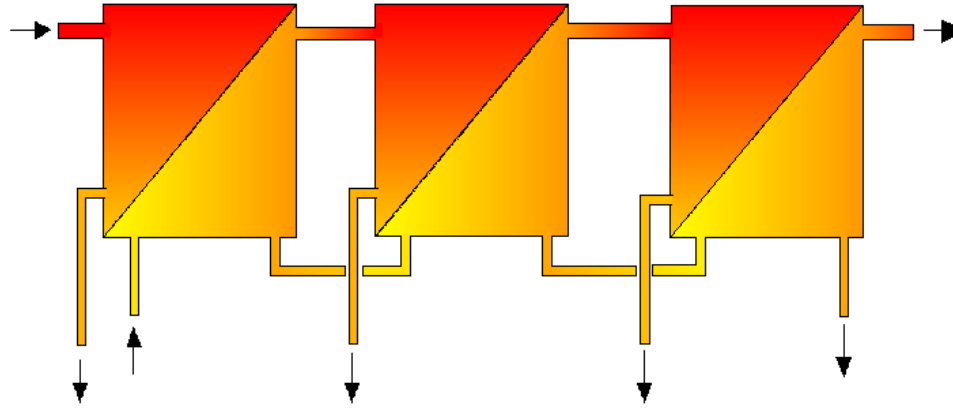

# Thermocompressor Analysis

- Thermocompressor analysis requires a thorough understanding of process needs
- Identify the source of waste (or low pressure) steam that is currently vented
- Identify a process that requires steam and is currently using high or medium pressure steam
- Identify motive steam (typically, highest pressure steam) available in the plant
- Work with a manufacturer to select a thermocompressor based on
  - Pressure ratios
  - Steam flows

# Evaporators & Use of Thermocompressors

Typical – 3 Effect

With Thermocompressor

Credit: Jim Munch, JMPS

# 4-Effect Thermocompressor

- Contamination in condensate?
- Temperature difference / Pressure ratio
- Very application and site specific

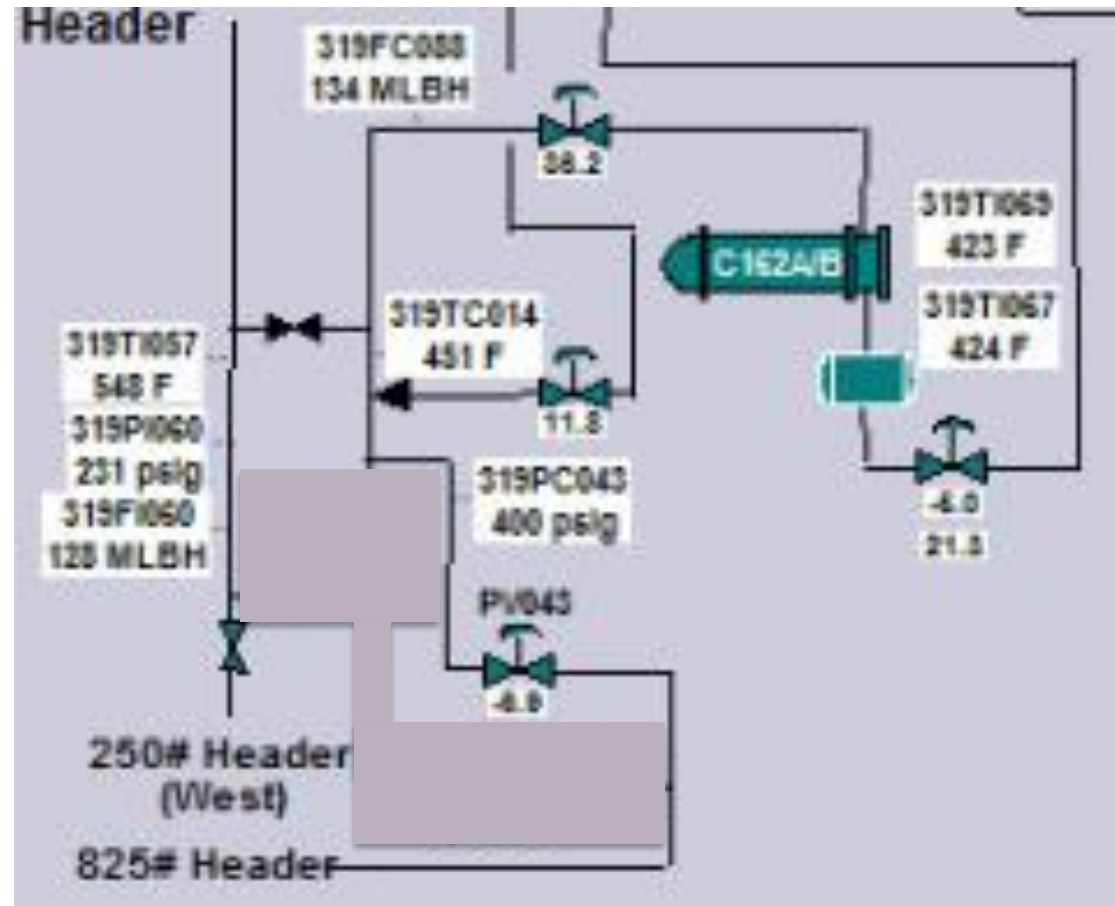

Credit: Jim Munch, JMPS

# Thermocompressor Analysis

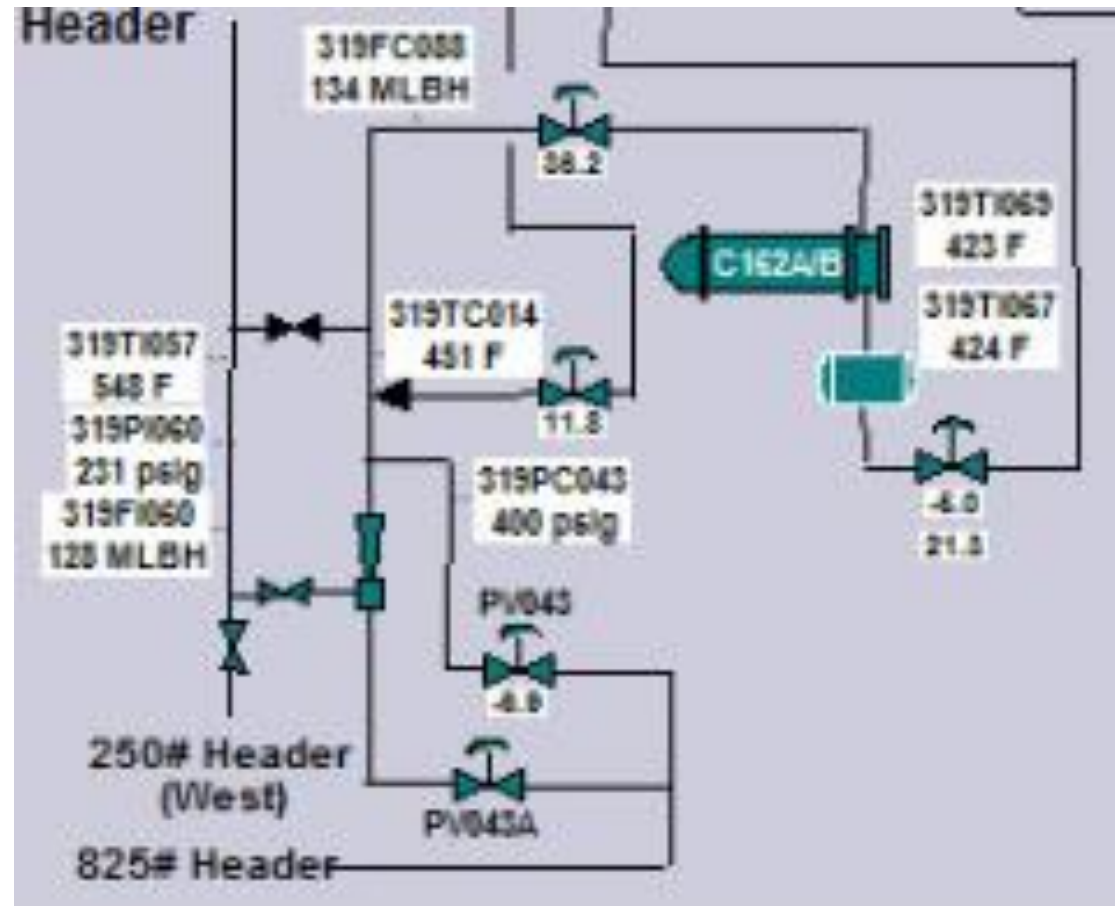

- Mass balance
- Energy balance
- Bernoulli's equation
  
- Motive steam
  - Eg. 300 psig
  
- Suction pressure
  
- Ratio
  
- Discharge pressure

# Case Study: Thermocompressor

# Case Study: Thermocompressor

# Case Study: Thermocompressor

- Petrochemical plant and oil refinery
- Steam demand
  - Pressure ~400 psig
  - Temperature ~425°F
  - Flow rate ~120 klb/hr
- Current Operation
  - Use Pressure Reducing Valve
  - HP steam header ~ 825 psig; 850°F superheated
  - Desuperheating with boiler feedwater

# Case Study: Thermocompressor

- Energy assessment revealed that the process has exothermic reactions and generates 250 psig saturated steam
- New Operation
  - Use a thermocompressor
  - Motive steam - HP steam header ~ 825 psig; 850°F superheated
  - Suction steam – 250 psig
  - Discharge steam – 400 psig; 425°F
  - Desuperheating, if needed, with feedwater

# Case Study: Thermocompressor

## Benefits

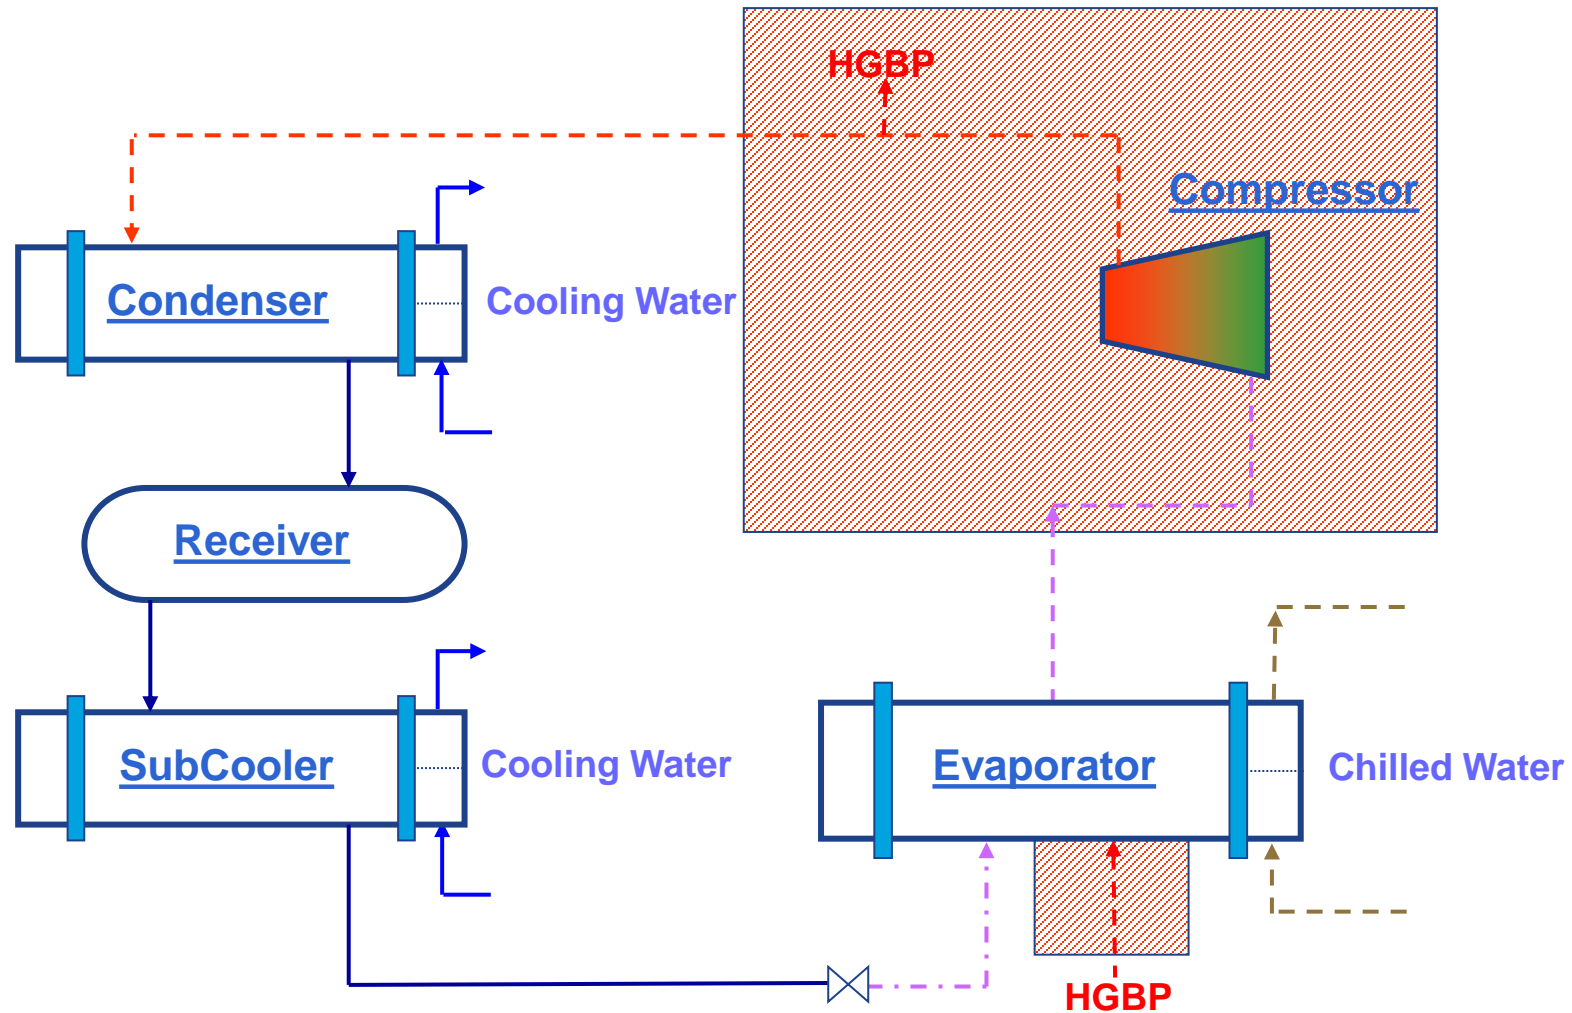

- Reduction in HP steam generation
  - Fuel: Natural gas (\$8/MMBtu)
  - Energy savings ~ 6.4 MMBtu/hr
  - Annual Cost savings ~\$450,000
- Installed cost ~\$150,000
  - Explosion proof refinery environment
- No moving parts – no maintenance costs for life
- Reduced feedwater usage
  - Estimated savings ~\$20,000

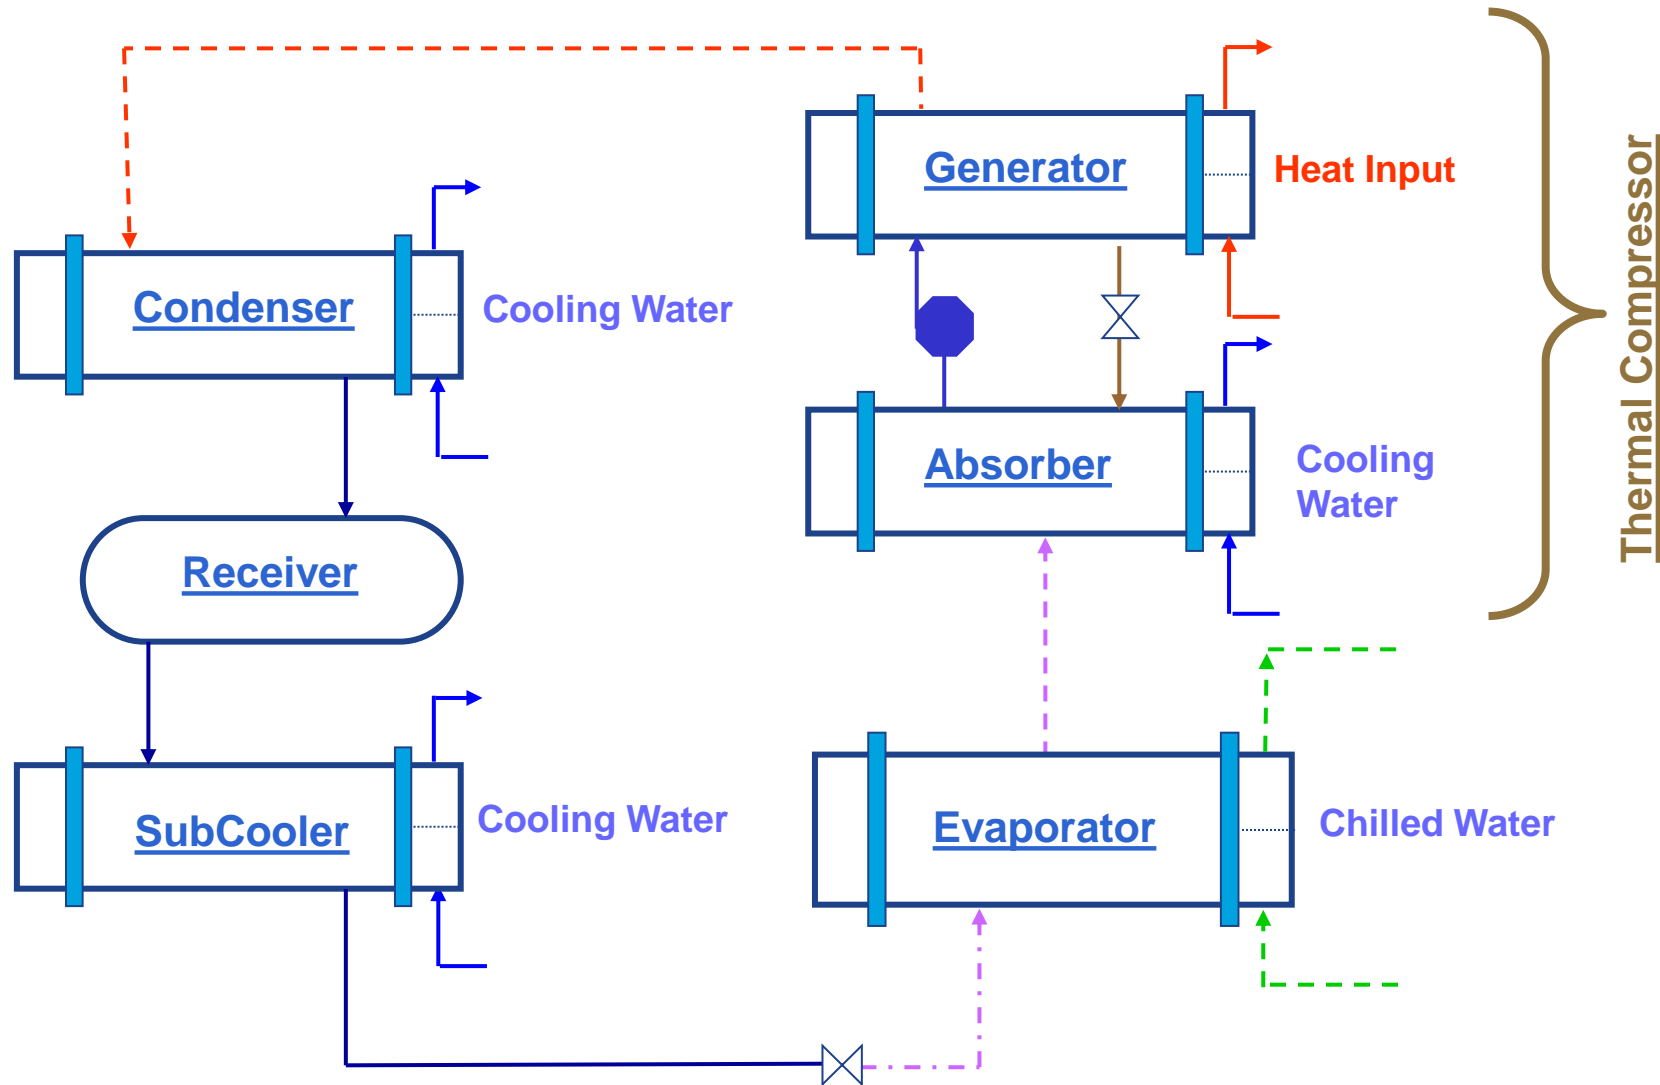

## Energy Efficiency Opportunities

- **Absorption Chillers**

# Absorption Chillers

# Absorption Chillers

# Absorption Chiller Systems

- Absorption systems have a pair of working fluids
- Working Fluids
  - Refrigerant side
    - Ammonia
    - Water
    - Other organic fluids
  - Solution (Absorbent) side
    - Water
    - Lithium Bromide
    - Other salts
- Nomenclature – refers to level of refrigerant concentration of the solution
  - Rich / Strong
  - Poor / Weak / Dilute
  - Intermediate

# Absorption Chiller Systems

- What impacts the choice of LiBr/H<sub>2</sub>O absorption chillers?
  - Driving Generator Temperature – Heat Source
- Single effect
  - Generator Temperature – 180 – 300°F
  - Waste heat fired
  - Hot water fired (180 – 220°F)
  - Steam fired (< 15 psig)
  - COP ~ 0.4-0.5
- Double effect
  - Generator Temperature – 275 – 350°F
  - Steam fired (> 50 psig)
  - Direct natural gas fired
  - COP ~ 0.9-1.0
- Triple effect
  - Generator Temperature – 350 – 400°F
  - Steam fired (> 100 psig)
  - Direct natural gas fired
  - COP ~ 1.2-1.4
  - NOT commercialized yet

# Ammonia Water Absorption

- Nevertheless, ammonia water absorption systems do exist all across the world
- They are mainly custom engineered for applications and this maybe one of the reasons that they may become more expensive then comparable LiBr/H<sub>2</sub>O systems and mechanical vapor compression systems
- One of the biggest advantage is the ability to produce chill temperatures **below 32°F**
- Refrigerant – Ammonia; Absorbent – Water
- Both substances are naturally available
- Ammonia has no GHG emissions or Global Warming impacts!

# Ammonia Water Absorption

- These systems can be designed to be fueled by:
  - Direct-fired (natural gas)
  - Steam
  - Hot water
  - Process waste heat
  - Exhaust waste heat
  - Geothermal
  - Solar
- High pressure depends on whether air-cooled or water-cooled condenser (range – 175-250 psig)
- Low pressure depends on the chilling temperature required

# Case Study - 100 RT Heat Pump/Chiller in Livingston, California, USA

- The unit supplies 100 RT of chilling and 3.2 MMBtu/hr water heating
- Driving force - Steam – 2.2 klb/hr at 50 psig

Credit: Energy Concepts Co.

# Case Study - 100 RT Heat Pump/Chiller

- The hot water and chilled water are required 20 hours per day, five days per week at a processing plant
- 44°F chilled water and 140°F hot water
- Saves 30% of water heating energy and 80% of chilling energy
- Operating cost savings ~\$120K per year
- Installation cost ~\$200K

Credit: Energy Concepts Co.
