

# Scope 3 Emission Considerations

Virtual INPLT Training

Session 6

Tuesday – May 30<sup>th</sup>, 2023

10:00 am – 12:30 pm EDT

## DOE's Waste Reduction Network:

- Open to all existing Better Plants partners
- Goals are flexible
- Six goal options based on partner feedback
- Quarterly webinars
- Bi-monthly newsletter
- Access to new waste-related tools, trainings and programmatic elements

### Waste Goal Options

# Waste Virtual INPLT Agenda

- **Week 1 (April 25<sup>th</sup>) – Introduction: Waste Diversion and Reduction 101**
- **Week 2 (May 2<sup>nd</sup>) – How to Effectively Track and Measure Your Waste**
- **Week 3 (May 9<sup>th</sup>) – Source Reduction and Waste Minimization Techniques**
- **Week 4 (May 16<sup>th</sup>) – Finding Outlets for Hard to Manage Waste Streams**
- **Week 5 (May 23<sup>rd</sup>) – Construction Waste Management and Green Building Certifications**
- **Week 6 (May 30<sup>th</sup>) – Scope 3 Emission Considerations**
- **Week 7 (June 6<sup>th</sup>) – Implementation of a Waste Diversion Program – Developing a Roadmap to Zero Waste**
- **Week 8 (June 13<sup>th</sup>) – Conclusions, Summaries, and Wrap up Presentations**

# Plan of Action

Today, we will:

- Review the previous training
- Discuss the homework
- Lecture on today's topic, "Scope 3 Emissions Considerations"
- Conduct a Q&A session
- Test your knowledge with a Kahoot! quiz

# Takeaways

## Today, you will learn:

- What are greenhouse gas emissions and their environmental impacts
- How to integrate sustainable considerations into sourcing and procurement
- What calculation methodologies exist for Scope 3 emissions
- An overview of greenhouse gas reporting frameworks and standards

## Waste Goal Options

# Presenters from Sustainable Solutions Corporation

**Tad Radzinski, PE, SEP,  
LEED AP, SFP**  
President  
Sustainable Solutions Corporation

**Nick Mummau, LEED Green  
Associate**  
Project Manager  
Sustainable Solutions Corporation

# Quick Review

## *Remembering Session 5*

**Session 5 Review:** Of the construction and demolition waste generated in the U.S., what percentage of the waste is from demolition?

Please respond to the Zoom poll

**Answer: 90%**

# Review: Construction Waste Management and Green Building Certifications

In the last session you learned to:

- Plan for construction and demolition (C&D) waste
- Develop a C&D waste management plan
- Understand the relationship between C&D waste management and green building standards as part of a company's carbon reduction and SBT goals
- Green building standard requirements for waste management

# Homework Discussion

# Homework Takeaways

## Overview

- Input waste data into the EPA's WARM tool and review the results. Write which wastes contribute the most to the emissions totals and describe if any influence from waste streams were surprising.

## Takeaways

- Surprise by the negative values in the results
  - Some uncertainty in how to interpret results depending on person's role. Some responders do not normally deal with emissions-related data or sustainability reporting
- In some cases, waste streams that seemed most prevalent in the dumpster were not as impactful to overall emissions, however, in some the two aligned

**Today's Topic:**  
***Scope 3 Emissions Considerations***

# Measuring Global Warming Impacts

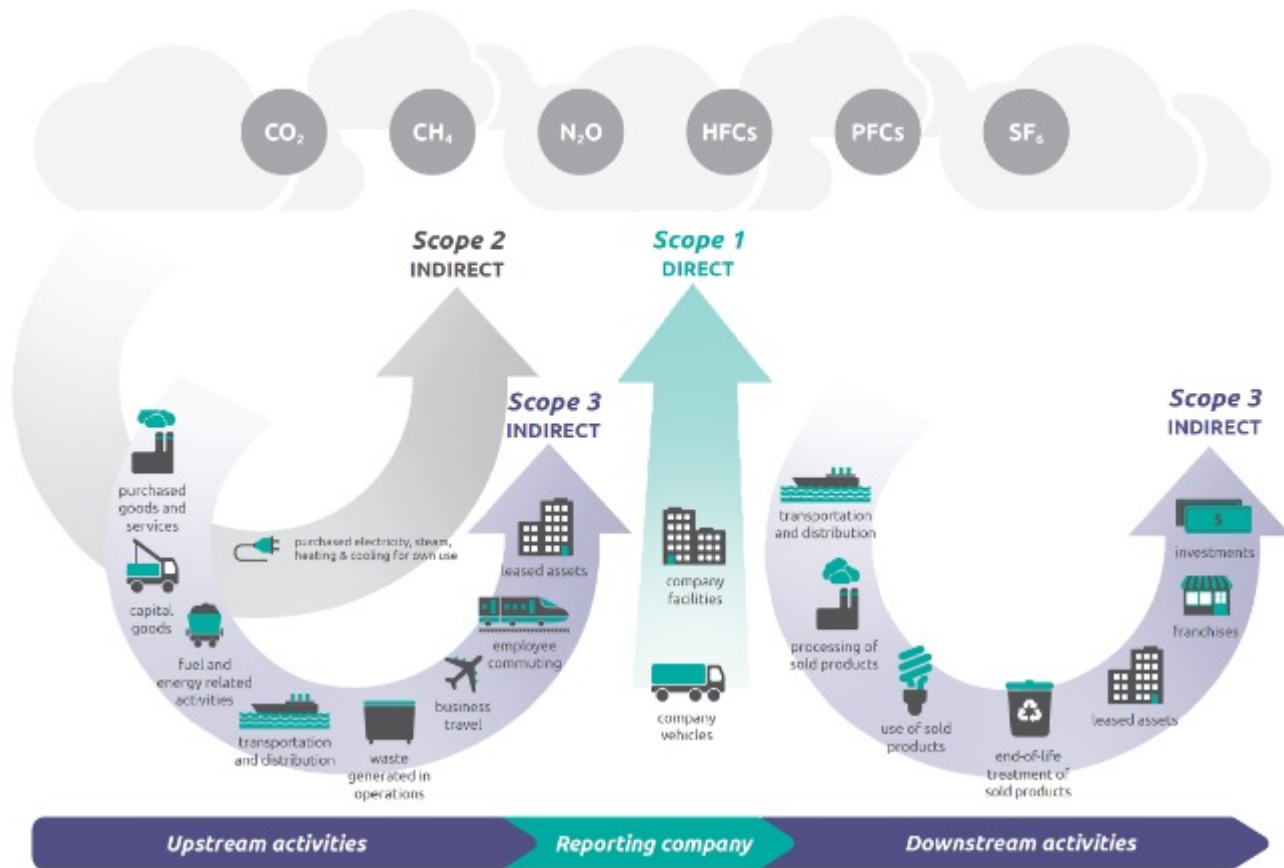

- A major focus for environmental stewardship programs is reducing greenhouse gas emissions
- Greenhouse gas emissions have an associated Global Warming Potential (GWP)
- Key terms to understand include:
  - Embodied carbon and operational carbon
  - Scope 1, Scope 2, and Scope 3 emissions
  - Carbon neutral and net zero

# Scope Emissions

## Overview of GHG Protocol scopes and emissions across the value chain

## OWNED DIRECT EMISSIONS

*Scope 1:* GHG emissions from sources owned and controlled by the company

## OWNED INDIRECT EMISSIONS

*Scope 2:* GHG emissions from utilities purchased by the company (electricity, steam, heat, etc.)

## UNOWNED INDIRECT EMISSIONS

*Scope 3:* All other GHG emissions that are linked to the company but do not fall into the other categories; they can occur upstream and downstream

[GHG Protocol](#)

# Scope 3 Emissions by Sector

How large are Scope 3 emissions?

Share of Scope 3 Emissions to Total Emissions, by Sector

Source: Data is from CDP. Research and analysis of the data was conducted by  WORLD RESOURCES INSTITUTE  
Concordia University.

[World Research Institute Scope 3 Disclosure Trends](#)

# Scope 3 Emissions Reduction Example

- Bristol-Myers Squibb utilized [Principals of Green Chemistry](#) to improve their sustainability efforts
- Focused on making significant reductions in the volume of their product packaging
  - Led to an approximate 40% reduction in transportation GHG emissions
  - Led to just under \$1 million in annual savings for shipping costs per year

**Bristol-Myers Squibb**

[Better Buildings Case Study:  
Bristol-Myers Squibb](#)

# Scope 3 Emission Categories

## Upstream or downstream

### Upstream scope 3 emissions

### Downstream scope 3 emissions

## Scope 3 category

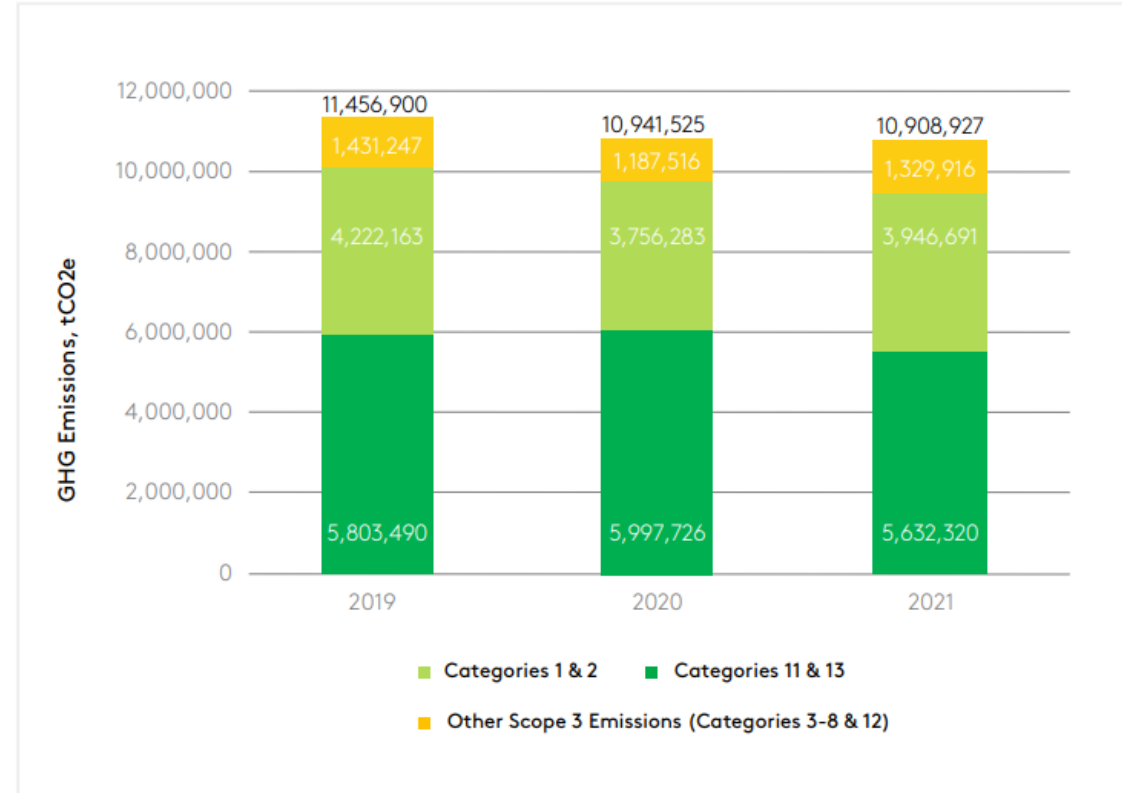

1. Purchased goods and services
2. Capital goods
3. Fuel- and energy-related activities (not included in scope 1 or scope 2)
4. Upstream transportation and distribution
5. Waste generated in operations
6. Business travel
7. Employee commuting
8. Upstream leased assets
9. Downstream transportation and distribution
10. Processing of sold products
11. Use of sold products
12. End-of-life treatment of sold products
13. Downstream leased assets
14. Franchises
15. Investments

The impact of each category will vary by company and industry

Within GHG considerations for Scope 3, there is an increasing focus on methane emissions resulting from waste end-of-life scenarios

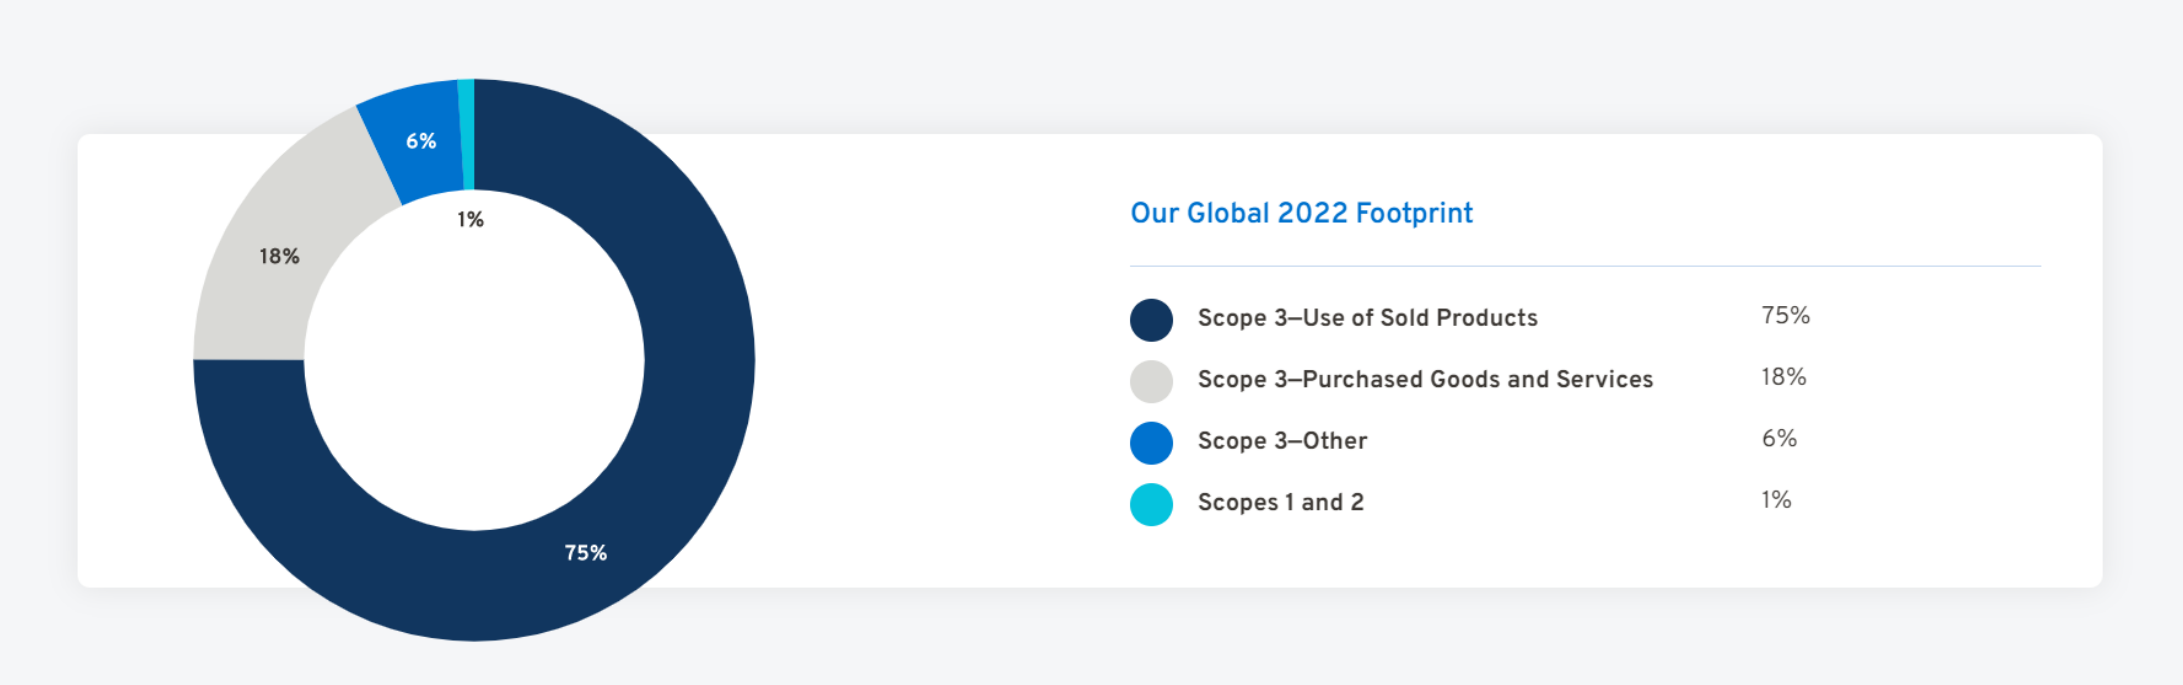

# Comcast Scope 3 Emissions Example

- Comcast's largest contributors to Scope 3 emissions are:
  - Purchased Goods and Services and Capital Goods along with Processing and Use of Sold Products

[Comcast Scope 3 Emissions Breakdown](#)

# General Motors Scope 3 Emissions Example

[Pepsi Climate Change](#)

Pepsi discloses how much of coverage they have in emissions reporting

## Climate Risk Assessment Overview

**Poll:** How much more potent is methane than carbon dioxide at trapping heat in the atmosphere?

Please respond to the Zoom poll

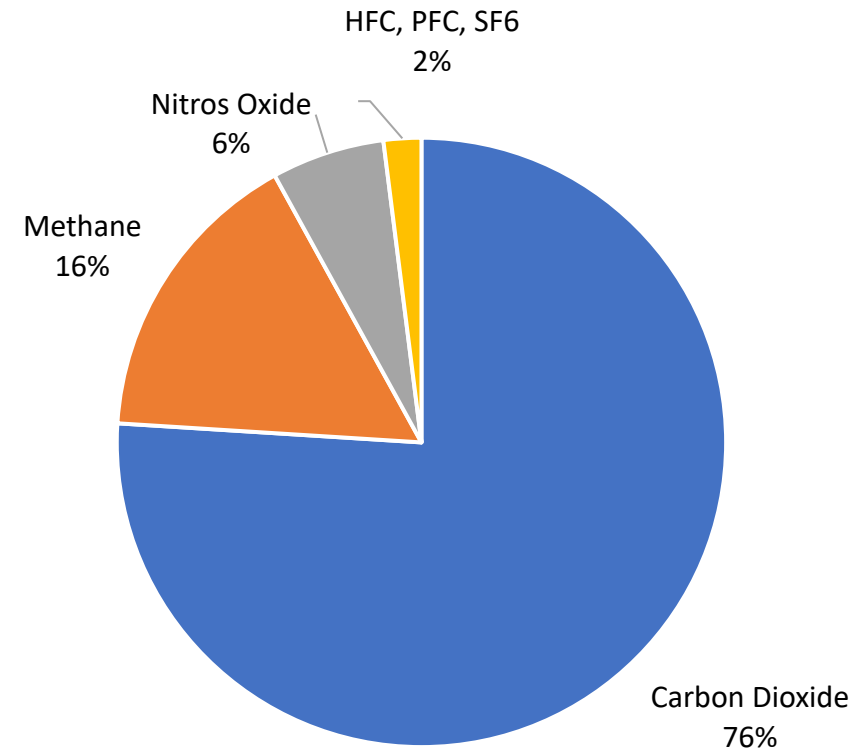

**Answer:** 25 times more potent

# The Facts About Methane

- Methane represents a large portion of global GHG emissions
- Methane is **25 times more potent** than carbon dioxide at trapping heat in the atmosphere

Global Manmade GHG Emissions by Gas, 2015

[EPA Source](#)

# Plans to Reduce Methane Emissions

- **Inflation Reduction Act** [IRA Guidebook](#)
  - Wide-reaching plan to provide funding for climate action for various programs and assistance relating to clean energy development, clean buildings, clean manufacturing, and much more
- **Global Methane Pledge** [Global Methane Pledge](#)
  - 115 countries commit to reduce their methane emissions by 30% by 2030
- **Declaration of North America (DNA)** [DNA](#)
  - U.S., Canada, and Mexico vowed to reduce methane emissions from solid waste and wastewater by 15% by 2030 from 2020 levels

# Plans to Reduce Methane Emissions

## Inflation Reduction Act

- \$1.55 billion in assistance for the EPA
  - Assistance to reduce methane and other GHG emissions from petroleum and natural gas systems
  - Waste emissions charge
    - Companies that report over 25,000 metric tonnes of CO<sub>2</sub>eq per year that are exceeding acceptable thresholds for methane emissions are susceptible to this charge
      - \$900 per metric tonne for emissions reported in 2024, which increases to \$1,200 in 2025, and \$1,500 in 2026 and on

[www.nj.gov/dep/dshw](http://www.nj.gov/dep/dshw)

Food waste that ends up in a landfill generates methane, a potent greenhouse gas contributing to global warming. This Law is intended to increase the amount of food waste that is recycled and converted into products like renewable energy, compost, and fertilizer. Therefore, whether or not you are required to comply with this Law, reducing and/or recycling your food waste is beneficial for the environment.

- An act focused on reducing methane emissions related to food waste
- Requires qualifying establishments to separate and divert their food waste

# Environmental, Social, and Governance (ESG) Reporting Frameworks

# Transparency

- There is increasing pressure and expectation for companies to disclose sustainability-related information
- Various platforms and frameworks exist to assist companies in disclosing correct and relevant information

# Demonstrating Environmental Leadership

## Investors Step Up Pressure On Companies That Don't Disclose Environmental Risks

“Climate change, deforestation and water security have become material issues to many industries. Investors require more comprehensive information and scientific analysis to address risks and opportunities derived from these issues,” said Sophia Cheng, chief investment officer at Cathay Financial Holdings.

[Forbes Article Link](#)

- Investors of publicly traded companies are putting more emphasis on sustainability initiatives
- Customers want to see environmental stewardship

# Transparency

FORBES > SMALL BUSINESS

## Green Business Is Good Business: Why Transparency Is Key For Corporate Sustainability

**Gary Steele** Forbes Councils Member  
Forbes Business Council COUNCIL POST | Membership (Fee-Based)

Research by Sprout Social found that 86% of Americans viewed transparency in business as “more important than ever before.” Similarly, 86% of respondents said, even after a bad experience, if a business has a good history of transparency, they would be more likely to give it a second chance. On top of that, 89% said they think a business would regain their trust if it’s been completely transparent about a mistake.

In an international study conducted by Unilever, they discovered that one-third of consumers are buying from brands that are seen as sustainable.

A recent survey discovered that 81% of global respondents felt organizations should be working to improve the environment, a sentiment shared across generational lines. The trend has been called the pursuit of

At the same time, we distance ourselves from viewing transparency as a corporate concept and see it for what it is – a real human quality. It’s been found that 94% of consumers are more likely to be loyal to a brand that’s completely transparent. Transparency also builds trust, trust that is foundational to your relationships with your employees and customers.

# Sustainability Reporting

## Global sustainability reporting inches closer to 100 percent among the world's largest companies

Sustainability reporting has become standard practice for many companies, with steady growth over the past decade. Our survey shows that the N100 companies have continued to steadily increase their reporting rates with each global survey. Ten years ago, 64 percent of the N100 companies reported. In 2022, 79 percent of these companies report.

Today, nearly all G250 companies report on sustainability. In 2022, the rate of reporting among the G250 remains at 96 percent, the same as 2020.

The only companies in the G250 that do not report on sustainability are in China; however, this is expected to change in the coming years. Reporting regulations were introduced in China from mid-2022, stipulating that listed Chinese companies must now disclose environmental and social information. The expectation is that the companies that have recently entered the G250 will report within the next 2 years.

For more than a decade, 90 percent or more of the G250 have reported on sustainability. The number of companies reporting since 2011 has fluctuated between 93 percent and 96 percent mainly due to the composition of companies in the G250.

# Sustainability Accounting Standards Board

## Reporting structure for disclosing impacts of company activities

- Calls for the disclosure of metrics specific to an industry that drive Scope 3 emissions
  - Intent is to help investors identify the companies positioned to adapt and manage Scope 3 emissions

### SASB Implementation Supplement: Greenhouse Gas Emissions and SASB Standards

SEPTEMBER 2020

- This supplement provides an overview of SASB's approach to greenhouse gas emissions and related topics in the SASB Standards.
- Reporting entities that wish to disclose Scope 1, 2, or 3 emissions, regardless of their industry, are not precluded from doing so when using SASB Standards. Disclosure of this information may be made alongside relevant SASB disclosures. This is consistent with the guidance provided in the "Use of the Standards" section of SASB Standards, available for download [here](#).

#### Contents

- 1 Introduction
- 2 Methodology and Background: Greenhouse Gas Emissions and SASB Standards
- 2 The Structure and Development of SASB Standards
- 4 Direct Emissions in SASB Standards
- 5 Indirect Emissions in SASB Standards
- 6 Future SASB Research

#### Introduction

SASB aims to facilitate more effective communication between companies and investors on the environmental, social, and governance (ESG) topics most relevant to long-term enterprise value creation. SASB's industry-specific disclosure standards are fundamental to achieving that goal. SASB Standards identify the subset of ESG issues reasonably likely to materially impact the financial performance of the typical company in an industry. The Standards are developed using a transparent due process that is evidence-based and market-informed.

This document provides a practical overview of how risks and opportunities related to greenhouse gas (GHG) emissions (Scope 1, Scope 2, and Scope 3) are captured in SASB Standards, including summarizing which industry standards include topics related to Scope 1, 2, and/or 3 GHG emissions. The Methodology and Background section of this document provides an explanation of SASB's standard-setting process and presents the rationale for the treatment of GHG emissions in the Standards.

Regardless of the specific disclosures recommended by SASB Standards, SASB recognizes that certain regulatory jurisdictions require disclosure of Scope 1, 2, and 3 GHG emissions across all industries. **Use of SASB Standards does not preclude disclosure of Scope 1, 2, and 3 GHG emissions by a company in any industry, either to meet regulatory requirements or to prepare disclosures in accordance with a framework such as the Task Force on Climate-related Financial Disclosures (TCFD) recommendations. (See below.)**

## AEROSPACE & DEFENSE Sustainability Accounting Standard

Sustainable Industry Classification System® (SICS®) RT-AE

Prepared by the  
Sustainability Accounting Standards Board

October 2018

INDUSTRY STANDARD | VERSION 2018-10

# CDP

- Manages the global disclosure system for investors, companies, cities, states, and regions to manage their environmental impacts
- Benefits of disclosing data to investors or customers through CDP:
  - Provides a framework
  - Satisfies the demands of customers, investors, and stakeholders for transparency and accountability
  - Minimizes the disclosing burden on companies (aligns with other reporting standards)
- Over 18,700 companies, worth over half of the global market capitalization, disclosed data through CDP in 2022, an increase of 42% since 2021

[CDP Data](#)

# CDP

- General emissions guidance provided
  - What to report and methodology
  - Ask for changes in company and reporting boundary year to year
- For Scope 3, options are provided per category for:
  - Evaluation status
    - Relevance, calculated or not, evaluated or not
    - Methodology
    - Explanations of responses
  - Guidance and examples provided
- References Greenhouse Gas Protocol throughout

# Science Based Target Initiative

- The Science Based Target initiative (SBTi) drives ambitious climate action in the private sector by enabling companies to set science-based emissions reduction targets

## Science-Based Target Setting Manual

Version 4.1 | April 2020

[SBTi Target Setting Manual](#)

[SBTi](#)

# Science Based Target Initiative

- Target setting manual provides guidance on:
  - How to calculate Scope 3 emissions
    - Conduct and inventory
    - Determine boundary
      - Should include at least two thirds of relevant Scope 3 emissions
      - Purchased Goods and Services along with Use of Sold Products are specifically called out as the majority contributor to Scope 3 emissions across sectors
  - How to set targets
    - Can set category specific targets or an overall target covering relevant categories
    - Targets can be absolute, emissions intensity, or supplier engagement
      - Supplier engagement relates to getting suppliers to adopt targets

[SBTi Scope 3 Management](#)

# Why Science Based Targets?

## Increase Innovation

- SBTs inform business strategy in a way that catalyzes the development of new technologies, products, and operational practices

## Strengthen Investor Confidence

- SBTs bolster credibility and reputation among stakeholders, including investors, customers, employees, and policy makers

## Boost Competitive Advantage

- 55% of companies with a SBT say they have gained competitive advantage from their targets

## Mitigate Risks

- Companies that have proactively assessed carbon risks and understand mitigation opportunities can be better prepared for future regulations

# Securities and Exchange Commission

## SEC Proposes Rules to Enhance and Standardize Climate-Related Disclosures for Investors

[Source 1](#)  
[Source 2](#)

# Scope 3 Emissions Calculation Methods

# Poll: Does your company currently track Scope 3 emissions?

Please respond to the Zoom poll

# Developing a Baseline

## What is a baseline and why is it important?

- Provides a starting point to reference, allowing the ability to monitor progress over time
- Enables establishment of realistic targets and goals
- Better understand performance and costs
- Develop material flow and spend analysis

*You can't manage what you don't measure*

# How to Calculate Scope 3 Emissions

- Follow established guidelines for calculating Scope 3 emissions
  - What data is needed, how to use the data, what the thresholds are, where assumptions can be made
- A significant amount of data will be required
  - Coordination with suppliers is likely needed for some categories
  - Focus on hotspots once data is obtained

# Greenhouse Gas Protocol

- The Greenhouse Gas Protocol (GHG Protocol) is a multi-stakeholder partnership of businesses, non-governmental organizations (NGOs), governments, and others
- Developed by the World Resources Institute and the World Business Council for Sustainable Development
- GHG Protocol provides internationally accepted greenhouse gas accounting and reporting standards and tools
  - Standards for Scope 1, 2, and 3 emissions
  - Supporting guidelines for calculating various Scope 3 categories
  - Specific guidance for some sectors

[GHG Protocol Scope 3 Guidance](#)

# GHG Protocol – Scope 3 Calculations

- Calculation methods:
  - Companies should use exact data where feasible
    - Average data methods are acceptable in situations where data is unavailable, or data source is not reliable
      - Sometimes supplier data, for example, can be inaccurate or unreliable
  - If data of sufficient quality are not available, companies can use consistent estimates (“proxy data”) to fill in gaps and disclose to ensure transparency
  - Overtime, companies should seek to replace lower quality data with higher quality data
- Boundaries and thresholds:
  - Acceptable boundaries vary by category
  - If a category is anticipated to be a significant contributor, it should be included
- GHG Protocol states that **calculated emissions should not be much higher or much lower than actual emissions**, to the best of ones’ ability

# GHG Protocol – Scope 3 Calculations

- How do we start?
  - Review Scope 3 categories and establish categories to prioritize based on:
    - Available data
    - Company focus
    - Stakeholder interests
  - Obtain data in-house and use that data to calculate emissions
  - Identify hotspot and key impact categories based on results
- How can we be certain our calculations are correct?
  - Establish internal data verification and calculation quality checks

# SBTi Example Case Study

- A chemical and gas company started with a screening of its value chain
- They investigated which Scope 3 categories contributed the most and which were not applicable at all
- This screening and analysis allowed them to focus reduction efforts on more specific items

**Box 6-2: Determining Relevant Scope 3 Categories**

[SBTi Industry Example](#)

# Review of GHG Protocol: Example

**Poll:** Is offsite waste treatment part of upstream or downstream Scope 3 impacts?

Please type your response in the chat

**Answer:** Upstream

## Category 5: Waste Generated in Operations

### Category description

**C**ategory 5 includes emissions from third-party disposal and treatment of waste generated in the reporting company's owned or controlled operations in the reporting year. This category includes emissions from disposal of both solid waste and wastewater.

Only waste treatment in facilities owned or operated by third parties is included in scope 3. Waste treatment at facilities owned or controlled by the reporting company is accounted for in scope 1 and scope 2. Treatment of waste generated in operations is categorized as an upstream scope 3 category because waste management services are purchased by the reporting company.

This category includes all future emissions that result from waste generated in the reporting year. (See chapter 5.4 of the *Scope 3 Standard* for more information on the time boundary of scope 3 categories.)

Waste treatment activities may include:

- Disposal in a landfill
- Disposal in a landfill with landfill-gas-to-energy (LFGTE) – that is, combustion of landfill gas to generate electricity
- Recovery for recycling
- Incineration
- Composting
- Waste-to-energy (WTE) or energy-from-waste (EFW) – that is, combustion of municipal solid waste (MSW) to generate electricity
- Wastewater treatment.

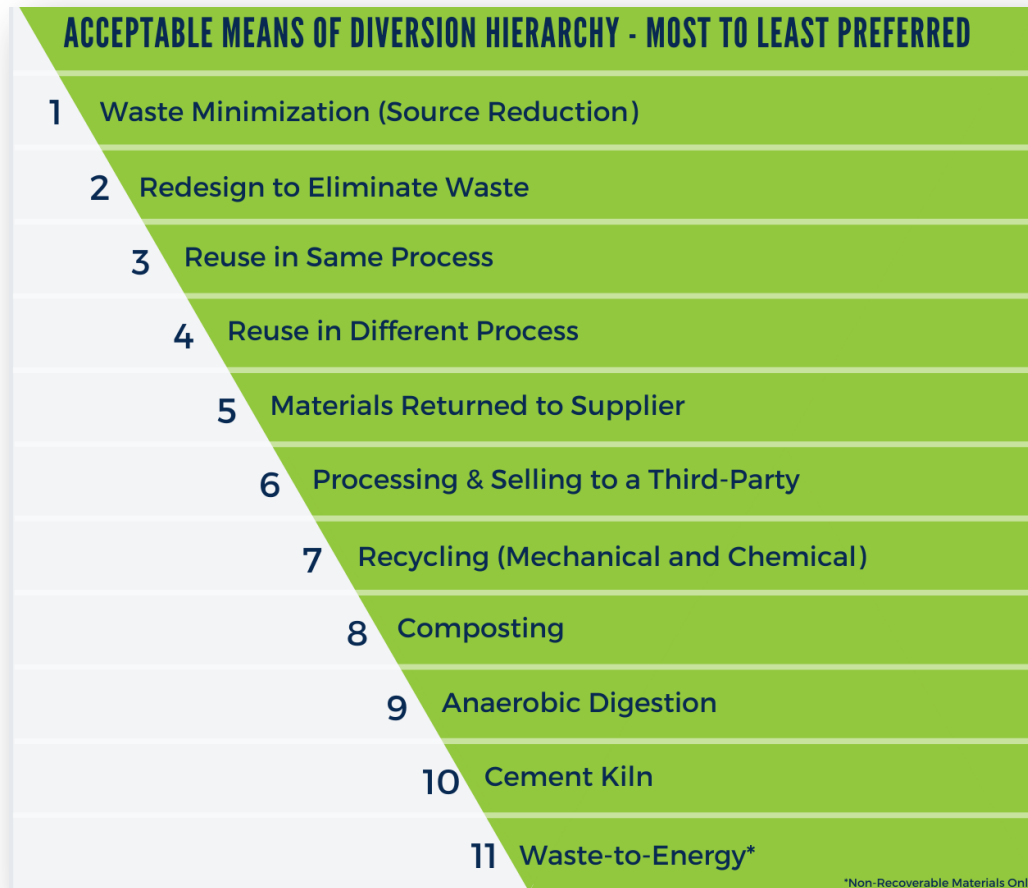

A reporting company's scope 3 emissions from waste generated in operations derive from the scope 1 and scope 2 emissions of solid waste and wastewater management companies. Companies may optionally include emissions from transportation of waste in vehicles operated by a third party.

## Evaluating Waste

- Calculating emissions related to waste treatment

# Waste Diversion Hierarchy

In general, strategies listed higher on the Waste Diversion Hierarchy result in less Scope 3 emissions than those lower on the hierarchy

# GHG Protocol – Waste Emission Calculation Guidance

- Three acceptable methods
  - Supplier-specific method
    - Collect Scope 1 and Scope 2 data directly from waste treatment company
  - Waste-type specific method
    - Use emissions factors for specific waste types and treatment methods
  - Average-data method
    - Estimate emissions based on total waste going to each disposal method and average emissions factors for each disposal method

5

## Category 5: Waste Generated in Operations

### Category description

**C**ategory 5 includes emissions from third-party disposal and treatment of waste generated in the reporting company's owned or controlled operations in the reporting year. This category includes emissions from disposal of both solid waste and wastewater.

Only waste treatment in facilities owned or operated by third parties is included in scope 3. Waste treatment at facilities owned or controlled by the reporting company is accounted for in scope 1 and scope 2. Treatment of waste generated in operations is categorized as an upstream scope 3 category because waste management services are purchased by the reporting company.

This category includes all future emissions that result from waste generated in the reporting year. (See chapter 5.4 of the *Scope 3 Standard* for more information on the time boundary of scope 3 categories.)

Waste treatment activities may include:

- Disposal in a landfill
- Disposal in a landfill with landfill-gas-to-energy (LFGE) – that is, combustion of landfill gas to generate electricity
- Recovery for recycling
- Incineration
- Composting
- Waste-to-energy (WTE) or energy-from-waste (EFW) – that is, combustion of municipal solid waste (MSW) to generate electricity
- Wastewater treatment.

A reporting company's scope 3 emissions from waste generated in operations derive from the scope 1 and scope 2 emissions of solid waste and wastewater management companies. Companies may optionally include emissions from transportation of waste in vehicles operated by a third party.

*Technical Guidance for Calculating Scope 3 Emissions*

[72]

# GHG Protocol – Waste Emission Calculation Guidance

- Where to obtain emissions factors for the waste-type or average-data method?
  - Lifecycle databases
  - Industry associations
  - National inventories
    - GHG protocol references the [2006 IPCC guidelines for national GHG inventories for waste](#)
    - EPA [WARM](#) tool

## Category 5: Waste Generated in Operations

### Category description

Category 5 includes emissions from third-party disposal and treatment of waste generated in the reporting company's owned or controlled operations in the reporting year. This category includes emissions from disposal of both solid waste and wastewater.

Only waste treatment in facilities owned or operated by third parties is included in scope 3. Waste treatment at facilities owned or controlled by the reporting company is accounted for in scope 1 and scope 2. Treatment of waste generated in operations is categorized as an upstream scope 3 category because waste management services are purchased by the reporting company.

This category includes all future emissions that result from waste generated in the reporting year. (See chapter 5.4 of the *Scope 3 Standard* for more information on the time boundary of scope 3 categories.)

Waste treatment activities may include:

- Disposal in a landfill
- Disposal in a landfill with landfill-gas-to-energy (LFGE) – that is, combustion of landfill gas to generate electricity
- Recovery for recycling
- Incineration
- Composting
- Waste-to-energy (WTE) or energy-from-waste (EFW) – that is, combustion of municipal solid waste (MSW) to generate electricity
- Wastewater treatment.

A reporting company's scope 3 emissions from waste generated in operations derive from the scope 1 and scope 2 emissions of solid waste and wastewater management companies. Companies may optionally include emissions from transportation of waste in vehicles operated by a third party.

*Technical Guidance for Calculating Scope 3 Emissions*

[72]

# Calculating Emissions Related to Waste Treatment

- The EPA created the Waste Reduction Model (WARM) to provide high-level estimates of potential greenhouse gas emissions reductions, energy savings, and economic impacts from several waste management practices for various waste streams
  - Source reduction
  - Landfilling
  - Recycling
  - Composting
  - Anaerobic digestion
  - Waste-to-energy

# EPA WARM Tool - Example

- End-of-life scenarios for wastes influence an organization's Scope 3 emissions
- Determining these emissions is only feasible through:
  - Proper waste, segregation, and diversion
  - Organized data
  - Coordination with MMOs

Emissions Breakdown by End-of-Life Scenario (metric tonne CO<sub>2</sub>eq)

| Material          | Weight (tons) | Landfill | Waste to Energy | Recycling | Compost |
|-------------------|---------------|----------|-----------------|-----------|---------|
| Mixed MSW         | 100           | 31       | 1               | -         | -       |
| Mixed Recyclables | 100           | 3.4      | (43)            | (285)     | -       |
| Cardboard         | 100           | 18       | (49)            | (314)     | -       |
| Paper             | 100           | 8        | (49)            | (355)     | -       |
| Mixed Plastic     | 100           | 2        | 126             | (93)      | -       |
| Mixed Metals      | 100           | 2        | (102)           | (439)     | -       |
| Food              | 100           | 50       | (13)            | -         | (12)    |

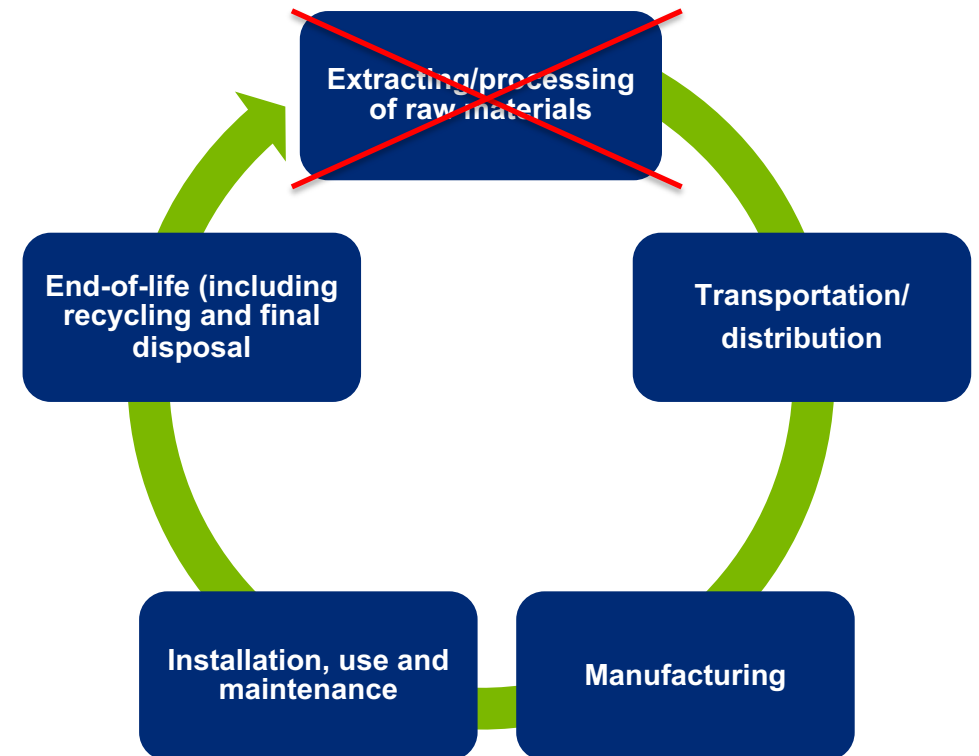

**Question:** What do you think negative values in waste emissions calculations represent?

Please type your response in the chat

**Answer:** Negatives represent offset raw materials

# EPA WARM Tool

- Recall LCA thinking
  - When materials are sent to landfill their useful life ends
  - Diverting waste extends a material's lifespan, subsequently preventing or removing need for virgin raw materials
    - The EPA's WARM tool gives credit for these offset raw materials, creating "negative" emissions
  - Keeping materials in use reduces or eliminates the "extraction/processing of raw materials" bucket of LCA impacts

# GHG Protocol – Waste Emission Calculation Guidance

## GHG Protocol’s explanation of recycling emissions:

- “The difference in emissions between extracting and processing virgin material versus preparing recycled material for reuse”
- “A reduction in emissions that would otherwise have occurred if the waste had been sent to landfill or other waste treatment method”

5

### Category 5: Waste Generated in Operations

#### Category description

Category 5 includes emissions from third-party disposal and treatment of waste generated in the reporting company’s owned or controlled operations in the reporting year. This category includes emissions from disposal of both solid waste and wastewater.

Only waste treatment in facilities owned or operated by third parties is included in scope 3. Waste treatment at facilities owned or controlled by the reporting company is accounted for in scope 1 and scope 2. Treatment of waste generated in operations is categorized as an upstream scope 3 category because waste management services are purchased by the reporting company.

This category includes all future emissions that result from waste generated in the reporting year. (See chapter 5.4 of the *Scope 3 Standard* for more information on the time boundary of scope 3 categories.)

Waste treatment activities may include:

- Disposal in a landfill
- Disposal in a landfill with landfill-gas-to-energy (LFGTE) – that is, combustion of landfill gas to generate electricity
- Recovery for recycling
- Incineration
- Composting
- Waste-to-energy (WTE) or energy-from-waste (EFW) – that is, combustion of municipal solid waste (MSW) to generate electricity
- Wastewater treatment.

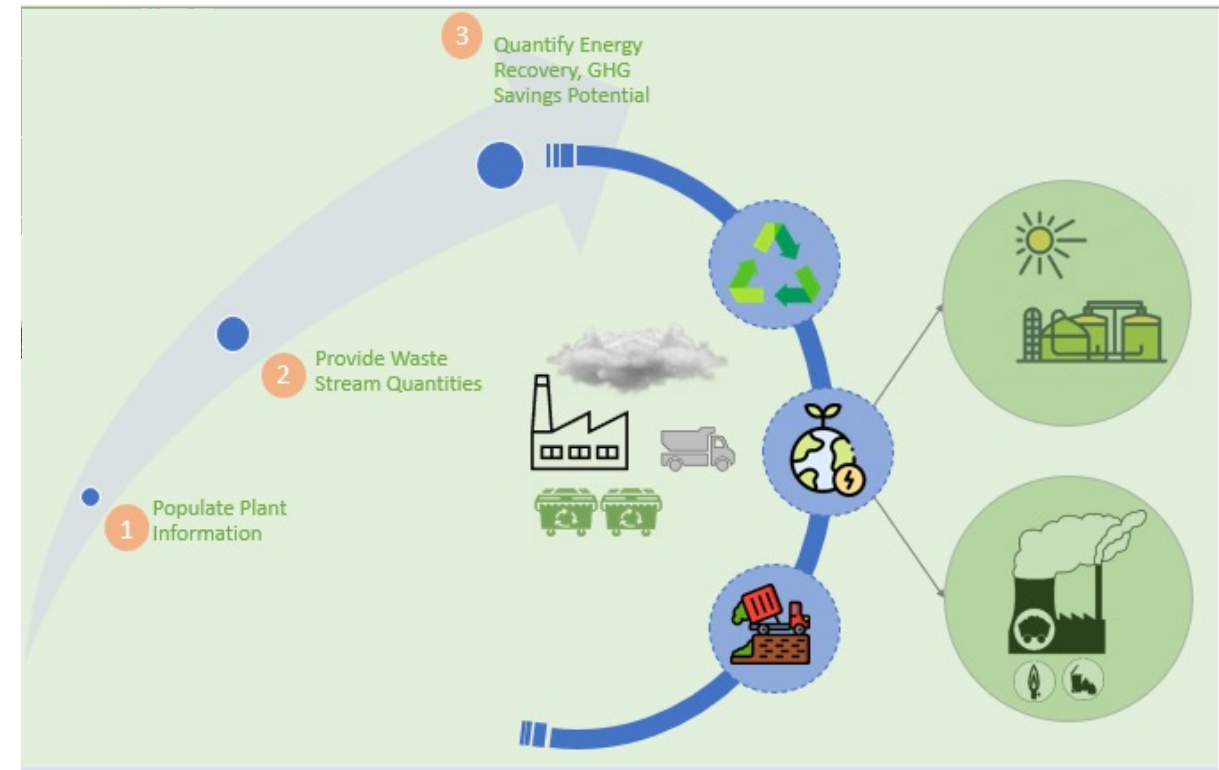

A reporting company’s scope 3 emissions from waste generated in operations derive from the scope 1 and scope 2 emissions of solid waste and wastewater management companies. Companies may optionally include emissions from transportation of waste in vehicles operated by a third party.

*Technical Guidance for Calculating Scope 3 Emissions*

[72]

# DOE Waste Stream Energy Content Calculator

- Is intended to quickly estimate the energy recovery potential of waste streams
- Calculator considers two main pathways for energy recovery
  - Direct Combustion
  - Anaerobic Digestion
- Evaluates onsite GHG impact resulting from energy recovery
- Considers waste streams that are currently landfilled or composted

[Waste Stream Energy Content Calculator | Better Buildings Initiative](#)

# DOE Waste Stream Energy Content Calculator

- For best results, enter all required data
  - Plant information, specifying industry type
  - Energy information, inputting annual energy usage, cost, and any offset energy
  - Waste information, describing waste generation and reduction activities
  - Enter energy recoverable waste stream data
    - Waste type
    - Outlet quantities
    - Waste management expenses
- Results include energy recovery, GHG recovery, and cost reduction potentials

# Estimating Methane Emissions

## 5 WASTE

### 5.1 CH<sub>4</sub> EMISSIONS FROM SOLID WASTE DISPOSAL SITES

#### 5.1.1 Methodological issues

Methane (CH<sub>4</sub>) is emitted during the anaerobic decomposition of organic waste disposed of in solid waste disposal sites (SWDS). Organic waste decomposes at a diminishing rate and takes many years to decompose completely.

##### 5.1.1.1 CHOICE OF METHOD

The *Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories* provides several methods to estimate CH<sub>4</sub> emissions from solid waste disposal sites. The first-order decay (FOD) method (Tier 2). The main difficulty with this method is that it produces a time-dependent emission profile that better reflects the actual decomposition process, whereas the default method is based on the assumption that all waste is disposed of. The default method will give a re

The Intergovernmental Panel on Climate Change (IPCC) provides guidance to calculate methane emissions

- Methane (CH<sub>4</sub>) is estimated to have a GWP of 27-30 over 100 years ([Learn why EPA's U.S. Inventory of Greenhouse Gas Emissions and Sinks uses a different value.](#)). CH<sub>4</sub> emitted today lasts about a decade on average, which is much less time than CO<sub>2</sub>. But CH<sub>4</sub> also absorbs much more energy than CO<sub>2</sub>. The net effect of the shorter lifetime and higher energy absorption is reflected in the GWP. The CH<sub>4</sub> GWP also accounts for some indirect effects, such as the fact that CH<sub>4</sub> is a precursor to ozone, and ozone is itself a GHG.

# Sustainable Sourcing and Procurement

# Contributions to Scope 3 Emissions

- Purchased goods and services contribute significantly to total emissions

## Total Greenhouse Gas Emissions for WRI, by Scope and Category

Filter scopes/categories: ■ Scope 1: Direct Emissions ■ Scope 2: Purchased Electricity ■ Scope 3, Category 1: Purchased Goods   
■ **Scope 3, Category 1: Purchased Services** ■ Scope 3, Category 1: Subgrants to Partners   
■ Scope 3, Category 3: Fuel- and Energy-related Activities ■ Scope 3, Category 5: Waste Treatment ■ Scope 3, Category 6: Business Travel   
■ Scope 3, Category 7: Employee Commute ■ Scope 3, Category 15: Investments

*Note:* GHG methods updated in 2019 include (1) base year updated to 2019 for 2030 targets, (2) scope 3 category 15 is included in the 2019-2030 SBT reporting period. See [Sustainability Dashboard Methodology](#) for more information.

[WRI Total Greenhouse Gas Emissions](#)

# Embodied Carbon Life Cycle

## EMBODIED CARBON

## OPERATIONAL CARBON

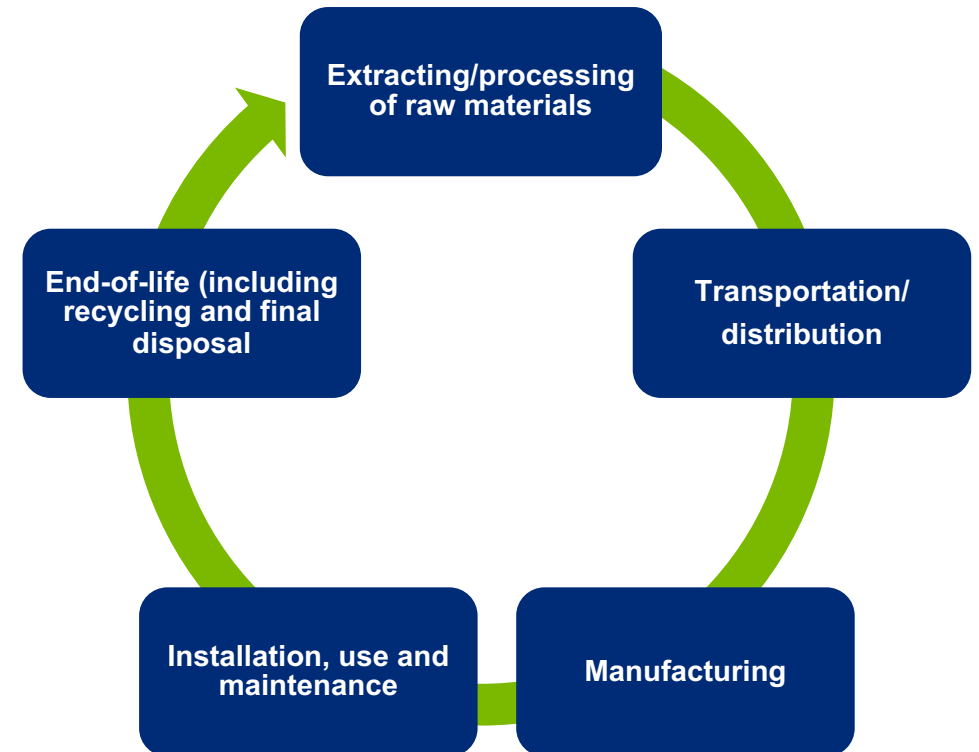

# Procurement and Life Cycle Assessment

## Recall life cycle thinking...

- Procurement has an impact on a product's life cycle
  - Where materials are extracted
  - How materials are manufactured
  - Where are materials shipped from
  - How often materials are shipped
  - How materials are transported
  - How materials are packaged

# How Can LCAs Be Used in Procurement?

Seeing a product's impacts can assist with focusing procurement efforts and reduce embodied carbon in a product

**Poll:** True or false - procurement is only related to the products purchased.

Please respond to the Zoom poll

**Answer: False**

# Integrating Responsible Sourcing and Procurement

## What is sustainable sourcing?

- The inclusion of social, ethical, and environmental factors into the process of selecting suppliers
- Procurement is not just related to products purchased, but includes services as well

# Integrating Responsible Sourcing and Procurement

- Scope 3 emissions can represent over 90% of company emissions [GHG Protocol statistic](#)
  - The supply chain is a large portion of these emissions
- However, sustainable procurement is not just emissions focused, it includes holistic sustainability considerations
- **What constitutes sustainable procurement?**
  - The integration of specifications which protect the environment and society
  - Institutes sustainability principles throughout the life cycle of a product

# What is Material to Your Company?

## Questions to consider when evaluating the sustainability of your supply chain strategy:

- What is essential to your business strategy and long-term sustainability of your organization?
- What resources, suppliers, and services are you reliant on?
- What inputs are vital to your business?
- What is critical to your stakeholders?

# Integrating Responsible Sourcing and Procurement

## Where to begin?

- Estimate how much your company's supply chain contributes to the entire emissions profile
  - Use this information to identify hotspots or areas of focus
    - Specific resources, suppliers, waste outlets, etc.
  - Create a list of suppliers or services who contribute to the focus area(s)

# Integrating Responsible Sourcing and Procurement

## What could sustainable sourcing include?

- Criteria within contractual agreements related to:
  - Data disclosure and information sharing
    - Include information requirements and frequency of reporting
  - Agreement to assist with sustainability initiatives
  - Sharing codes of conduct, ethics, or practices
    - Increasing number of companies have these available
  - Examples:
    - Leverage buying power to increase transparency and data sharing
    - Utilizing expertise to assist with internal initiatives
      - Example: requiring a material management organization (MMO) to assist with specific waste minimization and diversion efforts
    - Requiring building owners of leased assets to provide segregated dumpsters
    - Establishing criteria for takeback programs or develop packaging solutions to reduce waste

# Integrating Responsible Sourcing and Procurement

## What could sustainable sourcing include?

- Internal parameters for evaluating suppliers and services such as:
  - Prioritizing products which are made more sustainably
  - Requiring emissions data disclosure or similar
  - Prioritizing companies with third-party verification
  - Establishing sourcing distance requirements
    - Preferring regional options
  - Prioritizing sustainable material management options (waste outlets that will divert waste from landfill)
  - Requiring full trucks for shipping
  - Prioritizing companies with product stewardship or sustainability goals

# Sustainable Procurement Example: Federal Agencies

- **Executive Order: Catalyzing Clean Energy Industries and Jobs Through Federal Sustainability**
  - **Sec 208. Sustainable Acquisition and Procurement:**
    - **Agencies shall reduce emissions, promote environmental stewardship, support resilient supply chains, drive innovation, and incentivize markets for sustainable products and services by prioritizing products that:**
      - Can be reused, refurbished, or recycled
      - Maximizing environmental benefits and cost savings through use of **full life-cycle cost methodologies**
      - **Purchasing products that contain recycled content, are biobased, or are energy and water efficient**
      - **Purchasing sustainable products and services identified or recommended by the EPA**

# Integrating Sustainable Procurement

## How does sustainable procurement help reduce emissions?

- “You can’t manage what you don’t measure”
  - Forcing or encouraging suppliers to provide data may make them take a hard look at their own operations or risk being replaced by a company with lower impacts to your Scope 3 emissions
- Sustainable purchasing
  - Prioritizing products that have lower embodied emissions
  - Working with companies actively trying to reduce their emissions
- Innovative partnerships
  - Establishing programs to reuse materials, reduce packaging waste, or ship more efficiently

**Question:** Does the company you work for have procurement requirements related to sustainability? If so, what are they?

Please type your answers in the chat

# Benefits of Responsible Sourcing and Procurement

- Assist with risk-management against:
  - Scarcity of supply
    - Lower impact products and companies who focus on sustainability will be in larger demand
  - Increased demand in emerging markets
    - Establish connections with sustainability focused companies
  - Stakeholder pressure to reduce emissions
    - Being proactive will mitigate pressure
  - Protection of brand reputation
    - Companies in supply chain who are not focused on ESG could represent larger risks
    - Stakeholders want to see transparency

# Integrating Responsible Sourcing and Procurement

**Ecovadis, a business sustainability rater, provides measurable benefits to sustainable procurement**

15-30% brand value increase (equity)

90% have lower cost of capital

9-16% procurement cost reduction

[Ecovadis](#)

# Integrating Responsible Sourcing and Procurement

## What are the steps to integrate?

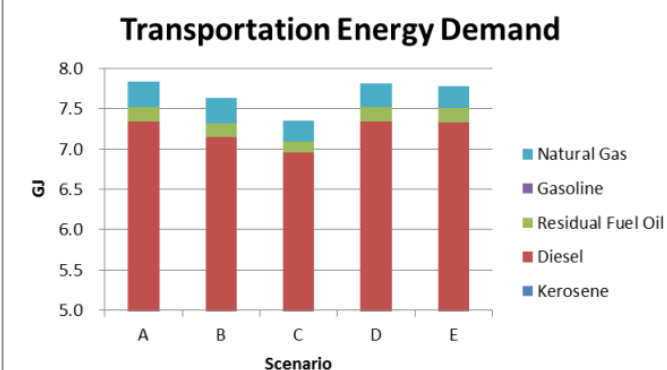

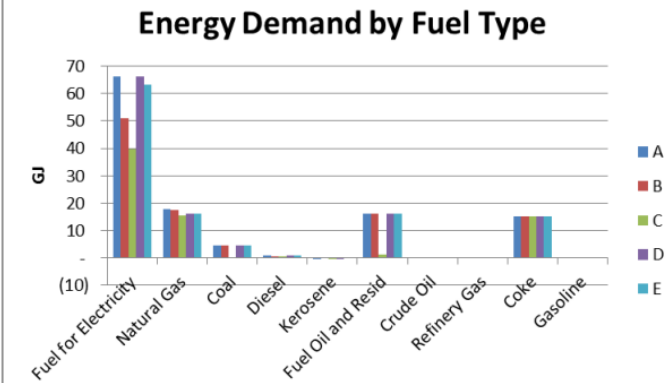

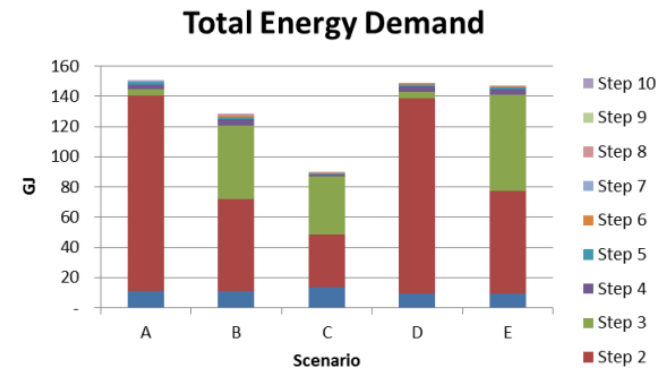

- Start with determining what sustainability criteria is most important (internally)
- Estimate how sustainable the site or company could be
  - Use data to understand baseline
  - Understand company goals
  - Establish a vision and assess its value
- Determine how your company will achieve internal goals
  - Establish core guidelines and initiatives
- Reach your goals
  - Revise policies and expectations as necessary
  - Reassess supply options

# Integrating Responsible Sourcing and Procurement

- The Material Flow Through Industry (MFI) tool provides impacts of a materials in the supply chain
  - [Request an account](#) to utilize the tool
  - Has over 1,000 manufacturing recipes to analyze
- Process:
  - Select materials and processes that are used to create final product
  - Input energy sources
- Results:
  - Energy required, GHG emissions, fuel use in manufacturing and transportation

# MFI Tool Example

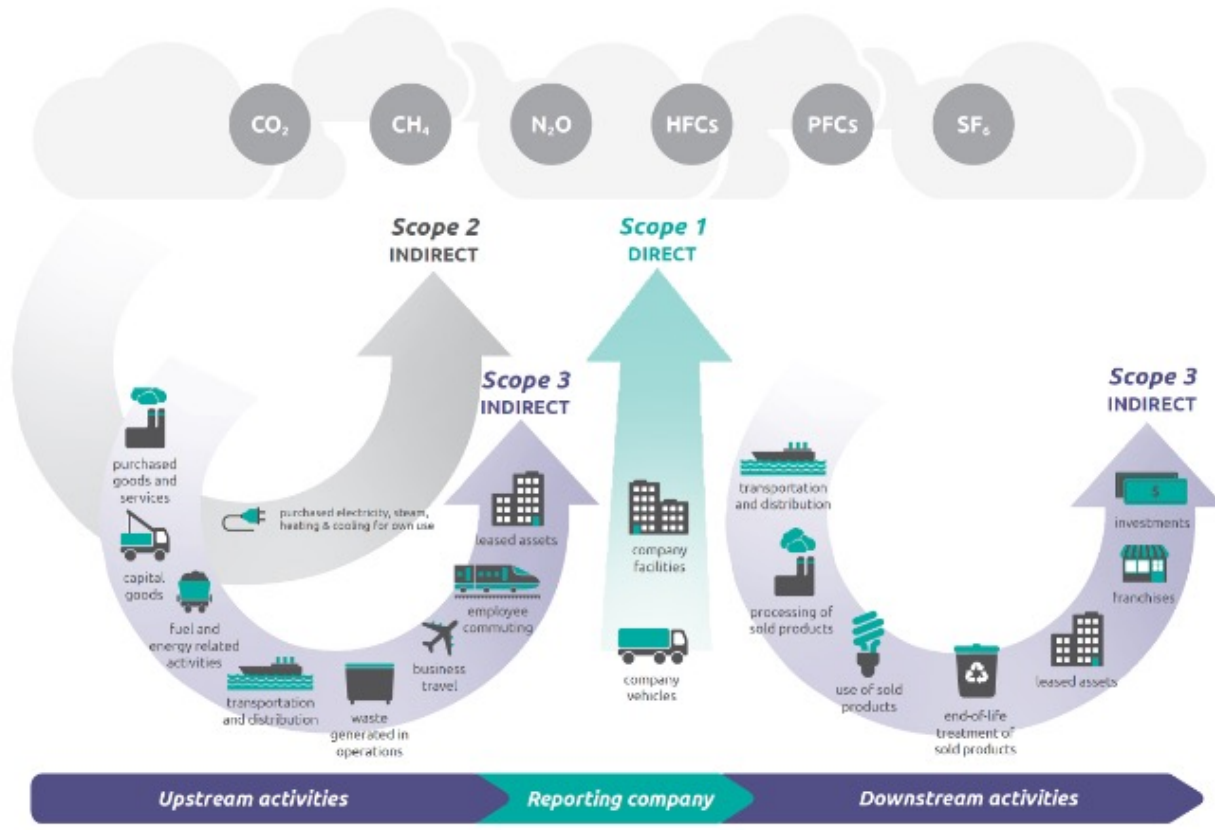

- Analyzed five scenarios for 1,000 kg of aluminum smelt
  - A** – Baseline (Modern Hall Heroult (MHH)); 0% SEP; national grid
  - B** – HH Wetted Cathode (TRL – 7 ) Process; 0% SEP; national grid
  - C** – Clay Carbochlorination (TRL – 6) Process; 0% SEP; national grid
  - D** – MHH process; 100% SEP; national grid
  - E** – MHH process; 100% SEP; 80% RE grid.

[NREL MFI Tool Example](#)

# Closing Remarks

Overview of GHG Protocol scopes and emissions across the value chain

## Summary

- What are emissions and their impacts
- How to integrate sustainable sourcing and procurement
- What calculation methodologies exist for Scope 3 emissions
- What reporting frameworks exist for emissions

## Homework!

## Next training:

- Implementing a zero waste to landfill program
- June 6, 2023

# Homework Overview

- Homework will:
  - Engage participants in the topics to be discussed in the following session
  - Serve as a guide for waste diversion and minimization
- If a homework is completed, please send to presenter, Nick, at [nick@sustainable-solutions.com](mailto:nick@sustainable-solutions.com)
  - Please use the subject “Better Plants Session # Homework: Complete – Company Name”
  - Participants will be asked to share their learnings and experiences in session 8, and if you would like to participate in this, please reach out to Nick

# Homework Review

## Assignment

1. What is the current waste diversion rate of your site and/or company? Note that some hazardous wastes may not be included in zero-waste to landfill verifications due to regulations requiring certain disposal. With hazardous waste removed, how close is the site and/or company to being zero waste to landfill? Note that zero waste to landfill is typically awarded if a site/company achieves over a 98% diversion rate.
2. Through the exercises in the previous homework assignments, are there any waste streams that were identified as being minimizable or divertible? Please note the estimated minimizable or divertible weight of each.
3. Based on the materials or streams identified in Question 2, how much would the waste diversion rate increase should potential improvements be implemented?
4. Based on the response to Questions 1 and 3, if the site and/or company is not achieving zero waste to landfill, what are the necessary steps to move towards this goal?

## Goal

- For a participant to establish a site and/or company's current progress in waste diversion.
- To have a participant begin to think about what it may take to increase waste diversion at their site and/or company.

# Kahoot!
